linked list (level 1 + level 2)

Lecture ① {Monday}

→ LL Basics

→ Display , Get At

→ Add
- last
- First

→ Remove
- last
- First

Lecture ② {Tuesday}

→ Add At

→ Remove At

LC 707 Design LL

→ Reverse linked list LC 206

- → Data Iterative $O(N^2)$
- → Pointer Iterative $O(N)$
- → Data Recursive $O(N)$
  - Local
  - Return
  - Static

Lecture (3) {Wednesday}

- → Display Reverse
- → Reverse LL
  Pointer Recursion
- → LL Reverse — LC HARD 25
- → Middle Node — LC 876
- → Kth node from end — GFG
- → Palindrome LL — LC 234

Lecture (4) {Thursday}

- → merge LL
  - → merge 2 Sorted — LC 21
  - → merge K Sorted — LC HARD 23
  - → merge Sort — LC 148
- → Big Integeres
  - → Addition of LL
  - → Subtraction of LL

Monday lecture (7) {8:30 PM to 12 Am}

→ Big Integers ↪ subtractn
↪ multiplication

→ Remove Duplicates (LC) 83 & 82
(1&1)

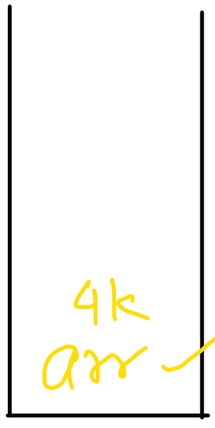
→ Fold & Unfold ith (LC) 143 & Pepcoding

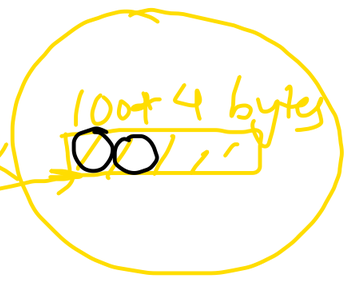
→ Remaining Problems.

ArrayList is an array of dynamic array → contiguous

Arrays : Contiguous memory Allocation

int[] arr = new int[100];



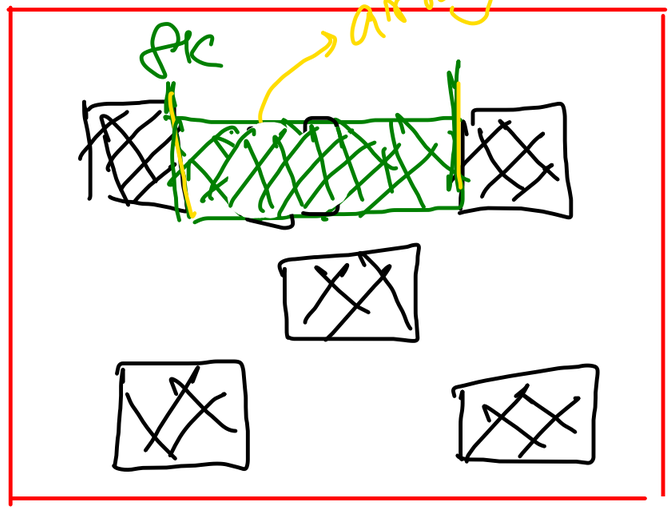


O(1) get

Random Access

16 integer

arraymaxsize



Memory is available

⇓

fragmentation

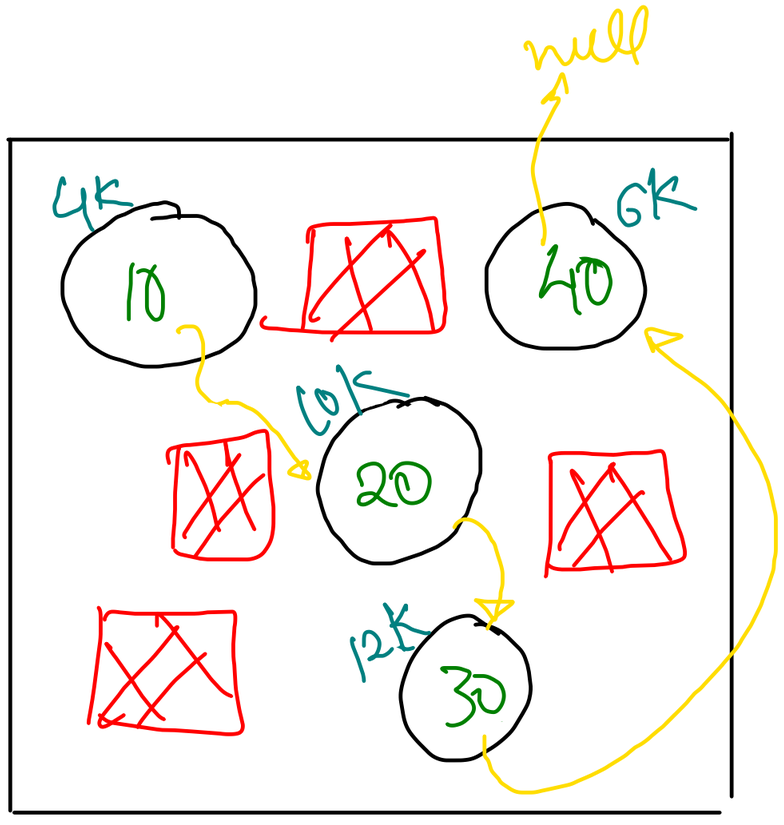
16 byte

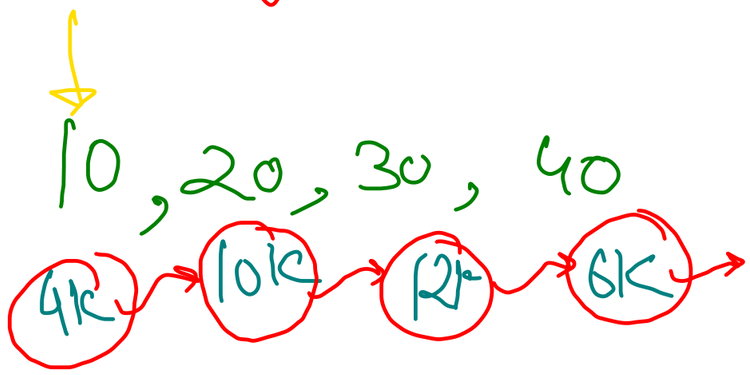
4k {10, 20, 30, 40}

Base index, index, size

Address of ith ele = Base Add + (i * size)

Singly linked list :→ Non contiguous memory allocation





class
Functions
Data member

public static Node{

int data;
Node next;

extra memory

}

public static
linkedList{

Node head;
Node tail;
int size;

```java
public static class Node{
    int data;
    Node next;
}
```

```java
public static class LinkedList{
    Node head;

    public void display(){

    }

    public void addFirst(int val){

    }

    public void addLast(int val){

    }

    public int get(int idx){

    }
}
```

Node fail; int size

Main( ) {

→ LinkedList list = new LinkedList();

→ list.addLast(10);

→ list.addLast(20);

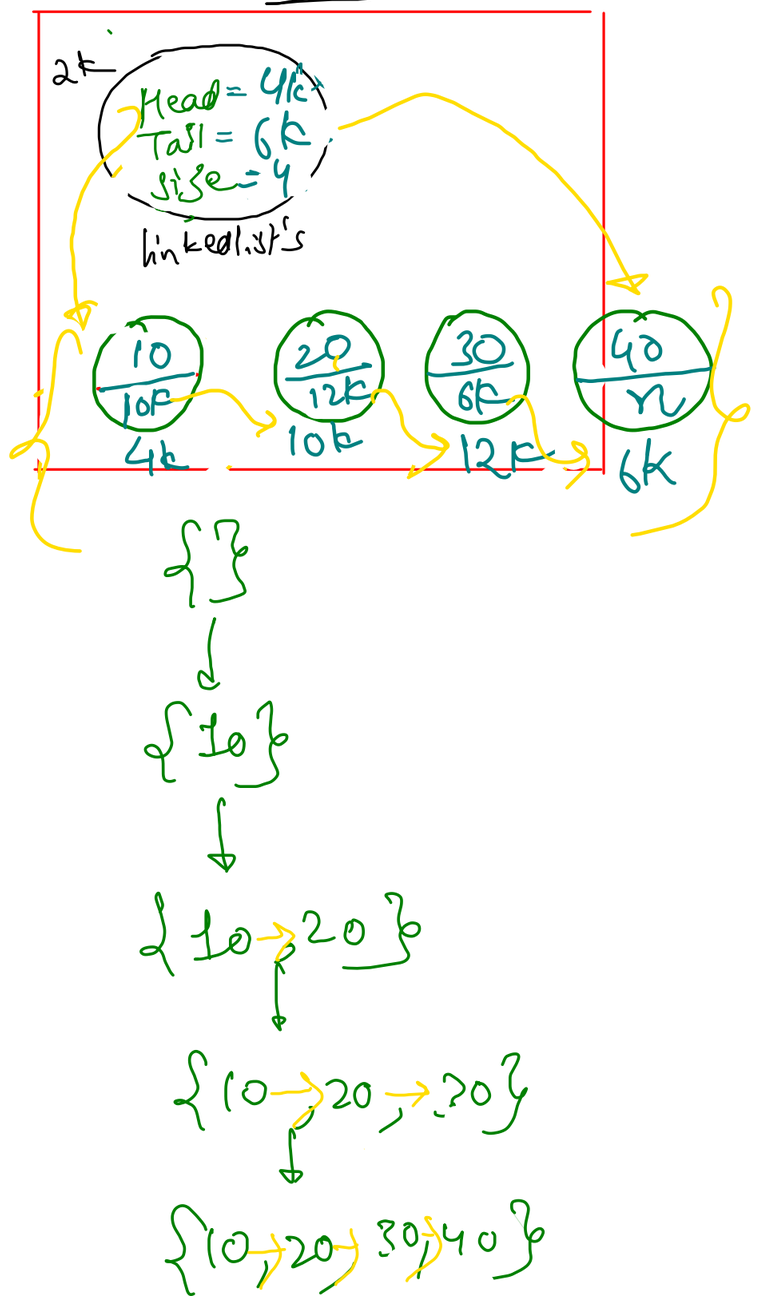
→ list.addLast(30);

→ list.addLast(40);

Stack

list = 2k

heap



Array

16 bytes

vs

LL

4 nodes → (4 bytes + 4 bytes) * 4

LL obj → (8+8+4) = 20 bytes

```java
public static class Node {
  int data;
  Node next;
}

public static class LinkedList {
  Node head;
  Node tail;
  int size;

  void addLast(int val) {
      // 1. Create a new Node
      Node temp = new Node();
      temp.data = val;

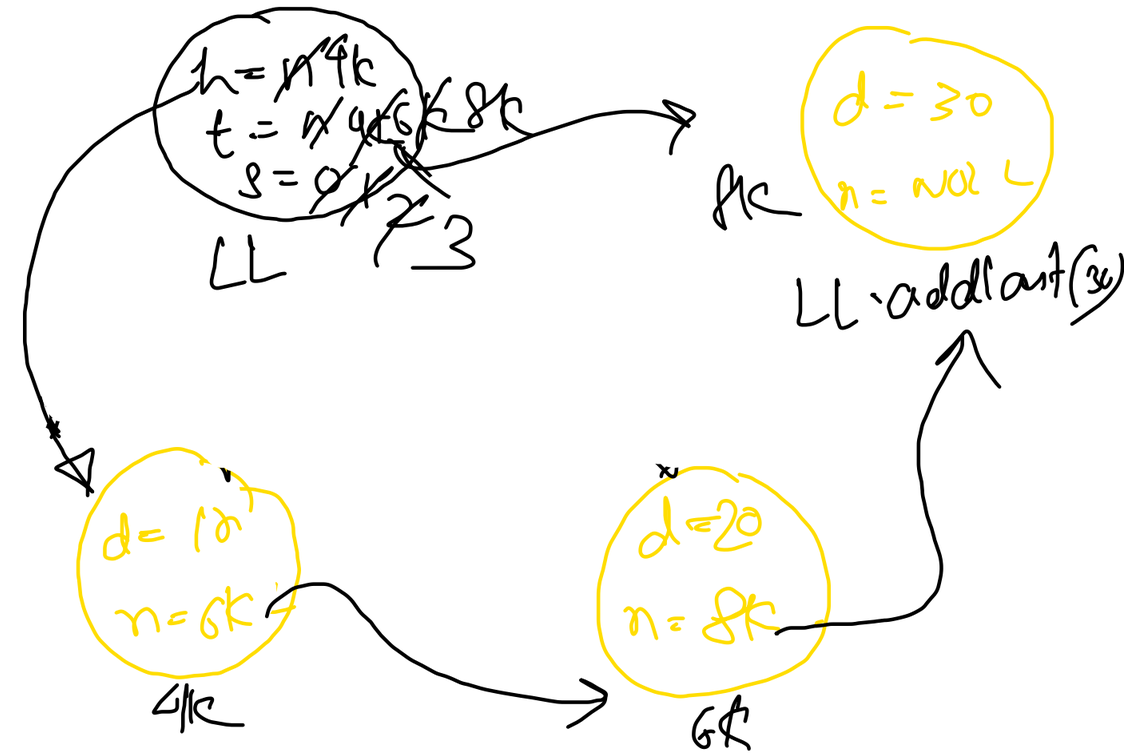
      if(size == 0){
          // new Node is the first as well as the last node
          head = temp;
          tail = temp;
      } else {
          tail.next = temp;
          tail = temp;
      }

      size++;
  }
}
```

tail
O(1)

If tail
was
not given
⇒ addLast would have costed O(n)

```java
LinkedList list = new LinkedList();
```



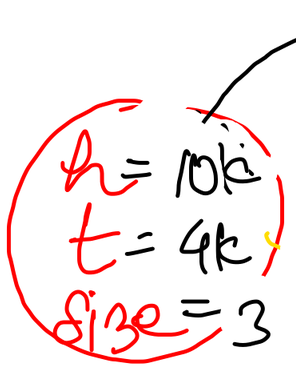
Disadvantages of Linked list over Array

1. → Extra space for storing 1 Node
2. → Random Access not available.

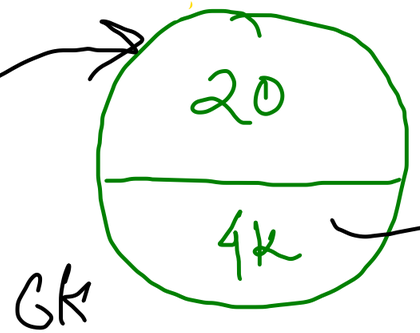
Advantages of Linked list over Array

1. → Non-contiguous memory allocation
2. → NO problem of fragmentation.

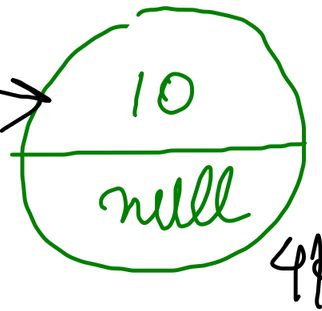
```
LinkedList list = new LinkedList();
```



LL.addfirst(30)



LL.addfirst(20)



LL.addfirst(10)

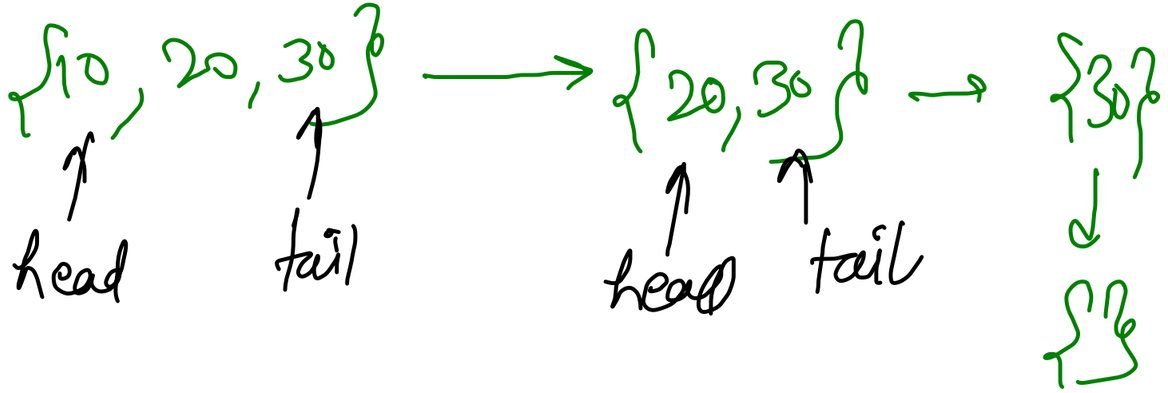
{} + {10} → {20,10}

{ 30,20,10 }

```
public void addFirst(int val) {
    // Creation of new Node
    Node temp = new Node();
    temp.data = val;

    if(size == 0){
        head = temp;
        tail = temp;
    } else {
        temp.next = head;
        head = temp;
    }

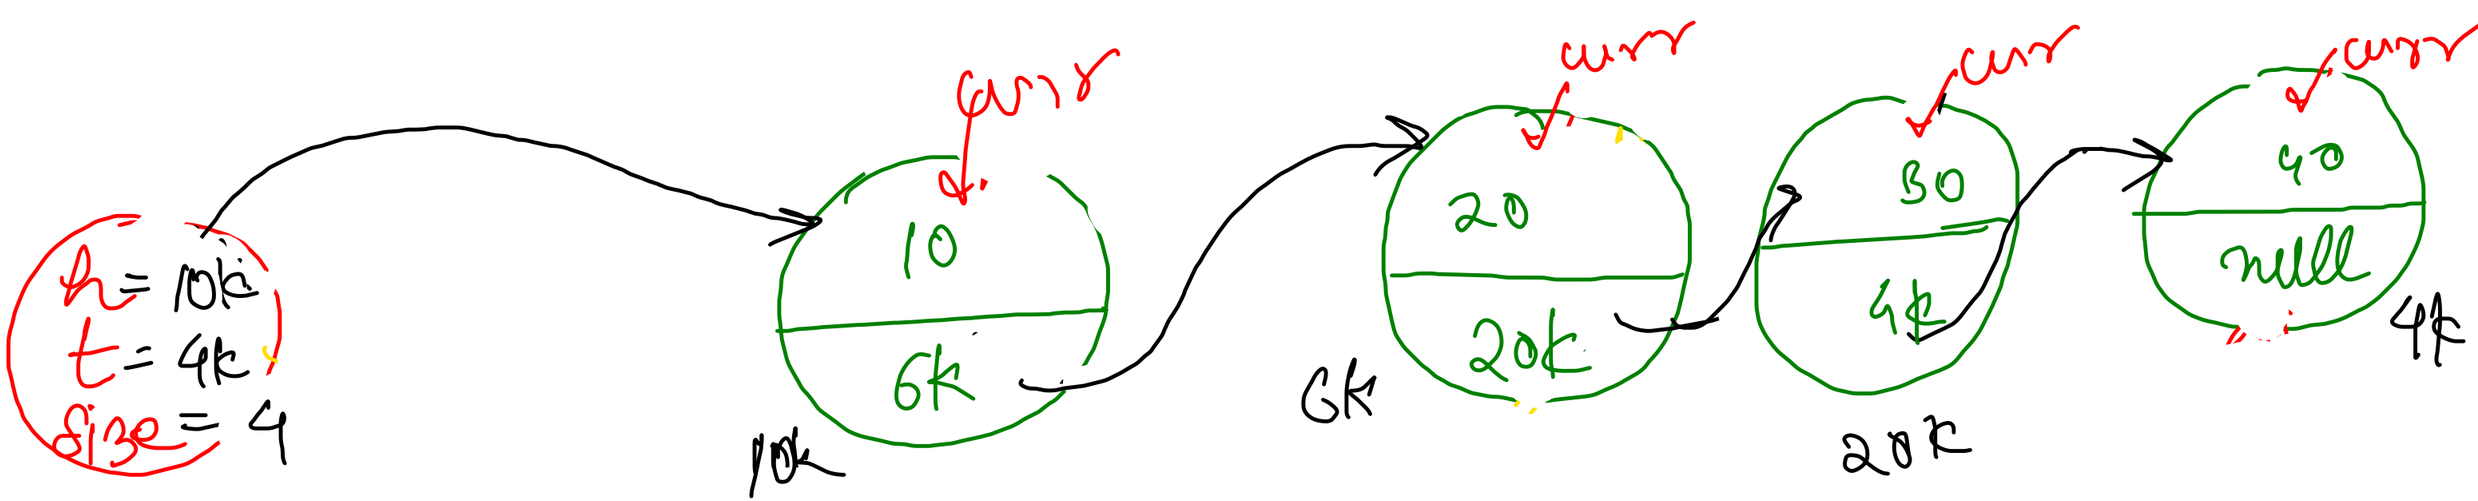
    size++;
}
```



```java
public void removeFirst(){
    if(size == 0) {
        System.out.println("List is empty");
        return;
    }

    if(size > 1){
        head = head.next;
    } else {
        head = tail = null;
    }
    size--;
}
```

O(1)



"Traversing/Displaying"

a LL

10, 20, 30, 40

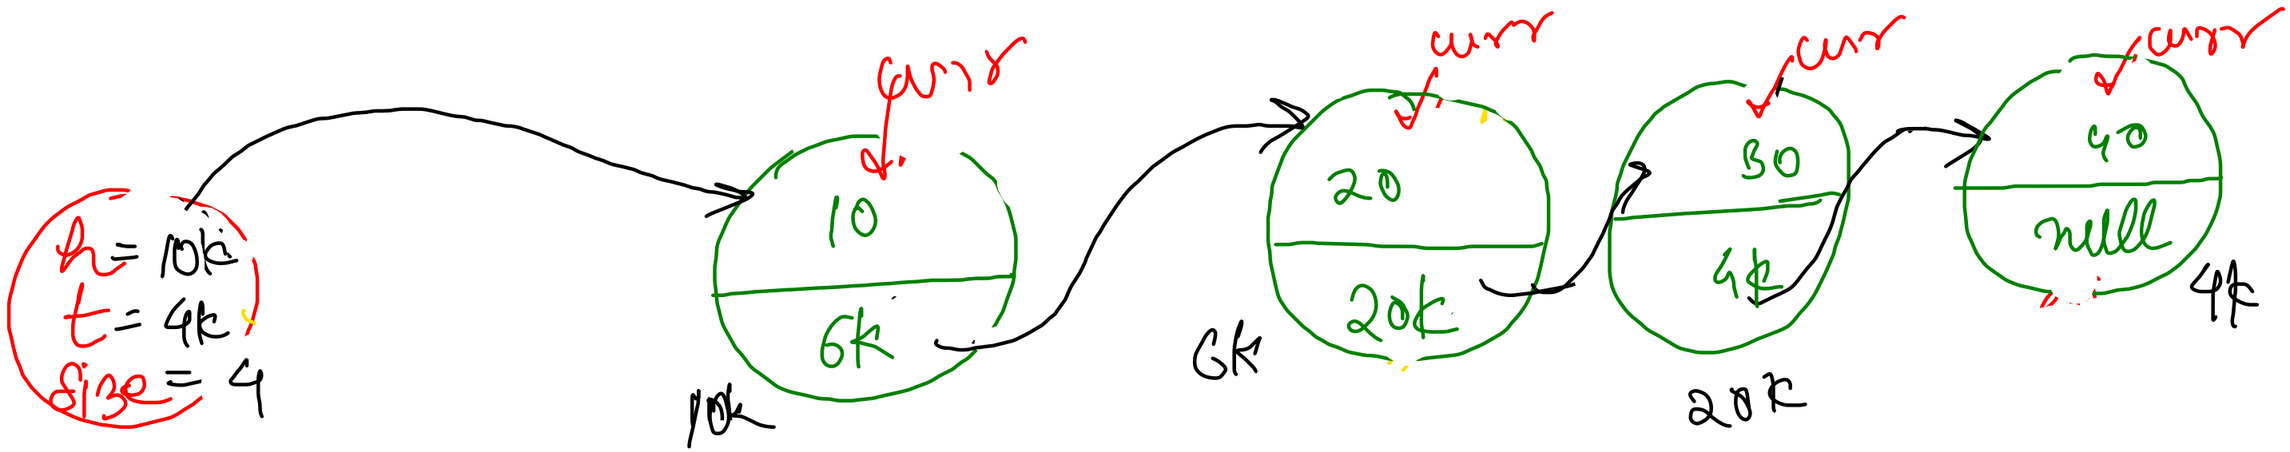
1st 2nd 3rd 4th

OR

```
for(Node curr = head; curr != null; curr = curr.next){
    System.out.print(curr.data + " ");
}
System.out.println();
```

```
public void display(){
    if(size == 0){
        return;
    }

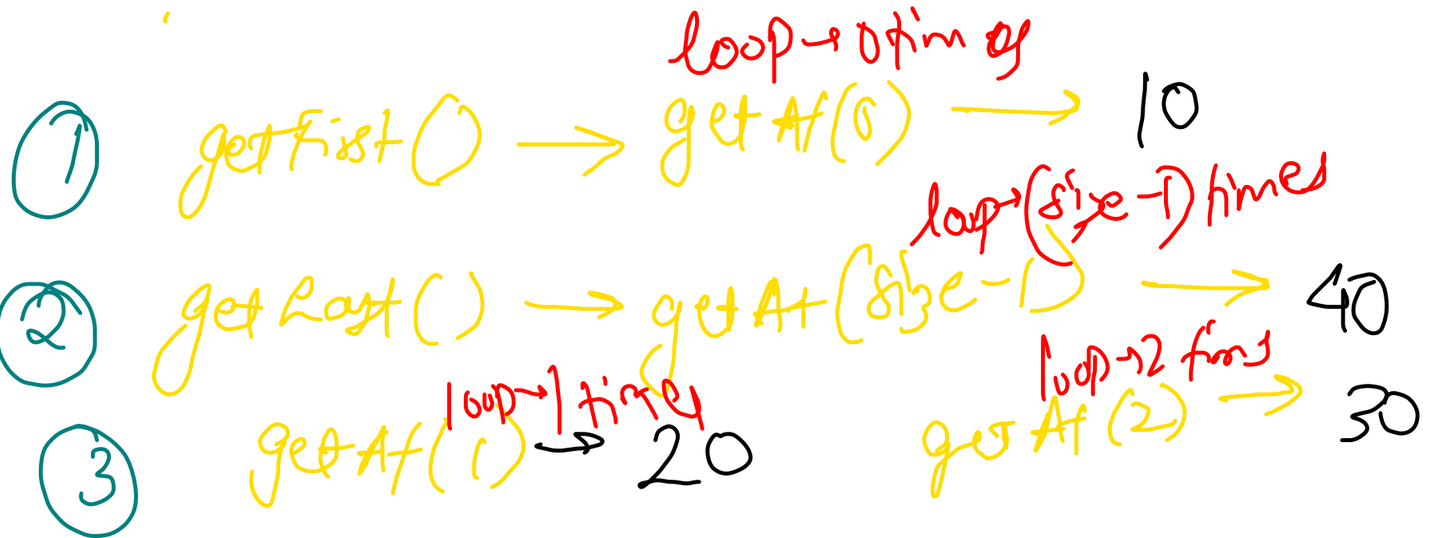
    Node curr = head;
    while(curr != null){
        System.out.print(curr.data + " ");
        curr = curr.next;
    }
    System.out.println();
}
```

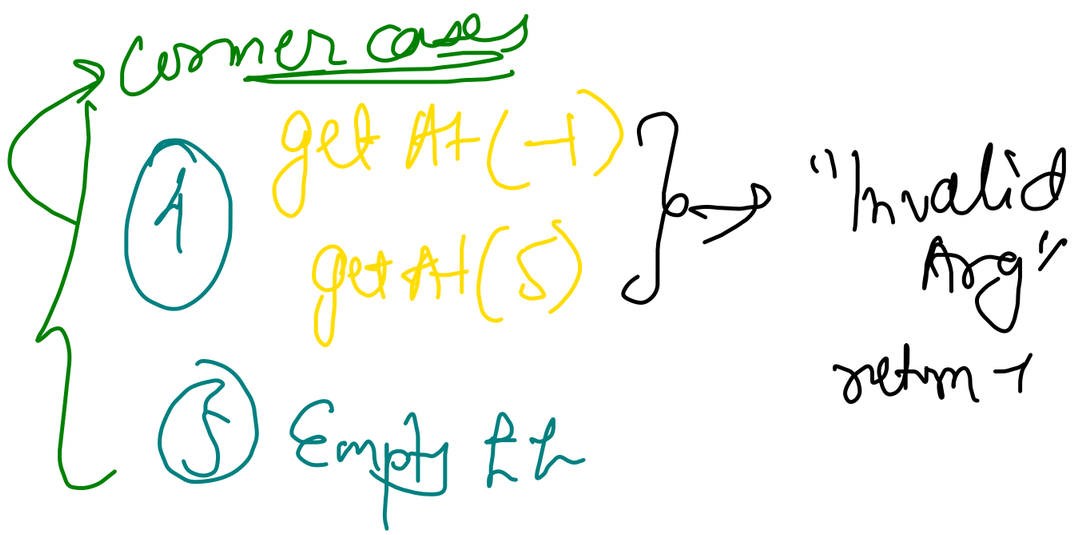


3.1. getFirst - Should return the data of first element. If empty should return -1 and print "List is empty".

3.2. getLast - Should return the data of last element. If empty should return -1 and print "List is empty".

3.3. getAt - Should return the data of element available at the index passed. If empty should return -1 and print "List is empty". If invalid index is passed, should return -1 and print "Invalid arguments".





```java
public int getFirst(){
    if(size == 0){
        System.out.println("List is empty");
        return -1;
    }

    return head.data;
}

public int getLast(){
    if(size == 0){
        System.out.println("List is empty");
        return -1;
    }

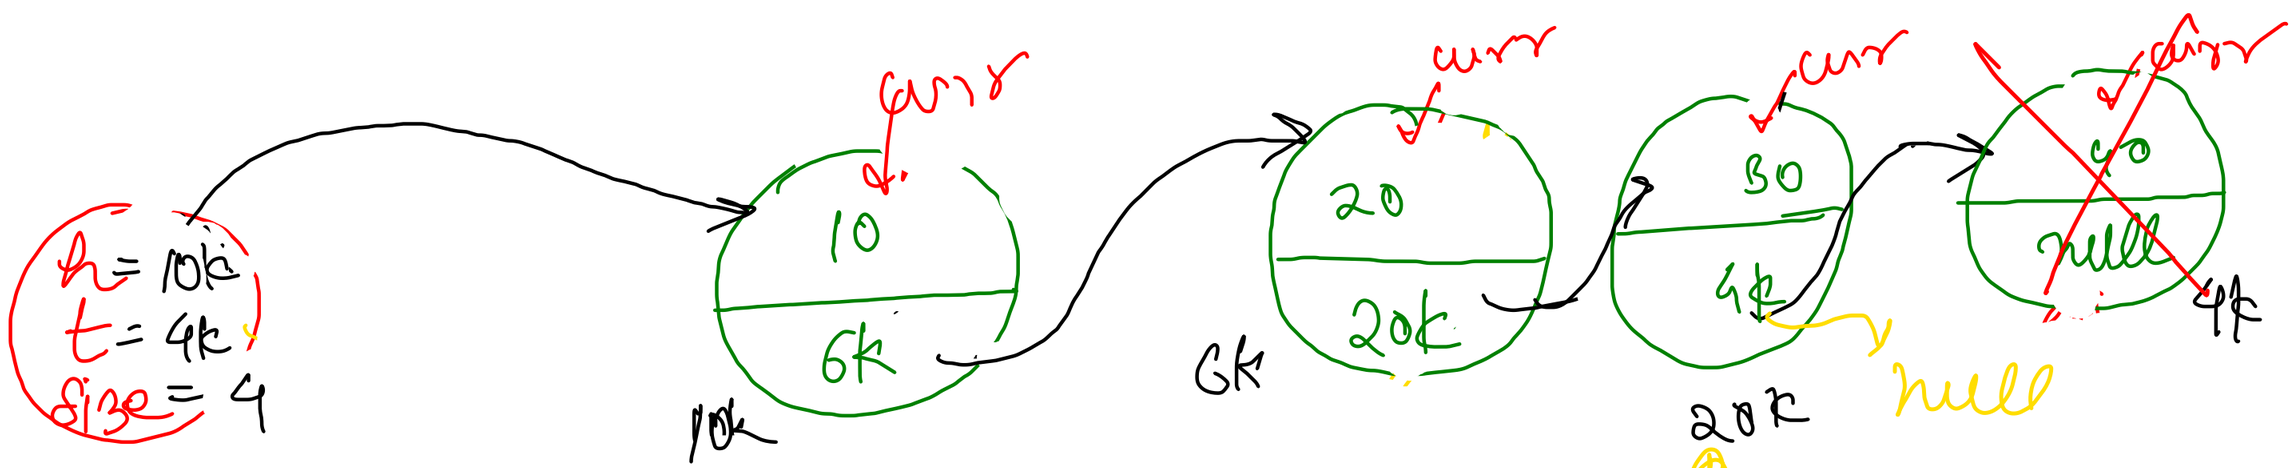
    return tail.data;
}

public int getAt(int idx){
    if(size == 0){
        System.out.println("List is empty");
        return -1;
    }
    if(idx < 0 || idx >= size){
        System.out.println("Invalid arguments");
        return -1;
    }

    if(idx == 0) return getFirst();
    if(idx == size - 1) return getLast();

    Node curr = head;
    for(int i=0; i<idx; i++){
        curr = curr.next;
    }
    return curr.data;
}
```

O(N)



Remove last

```
if(size>1){
    Node prevTail = getAt(size-2);
    prevTail.next = null;
    tail = prevTail;
}
```

```java
public void removeLast(){
    if(size == 0){
        System.out.println("List is empty");
        return;
    }

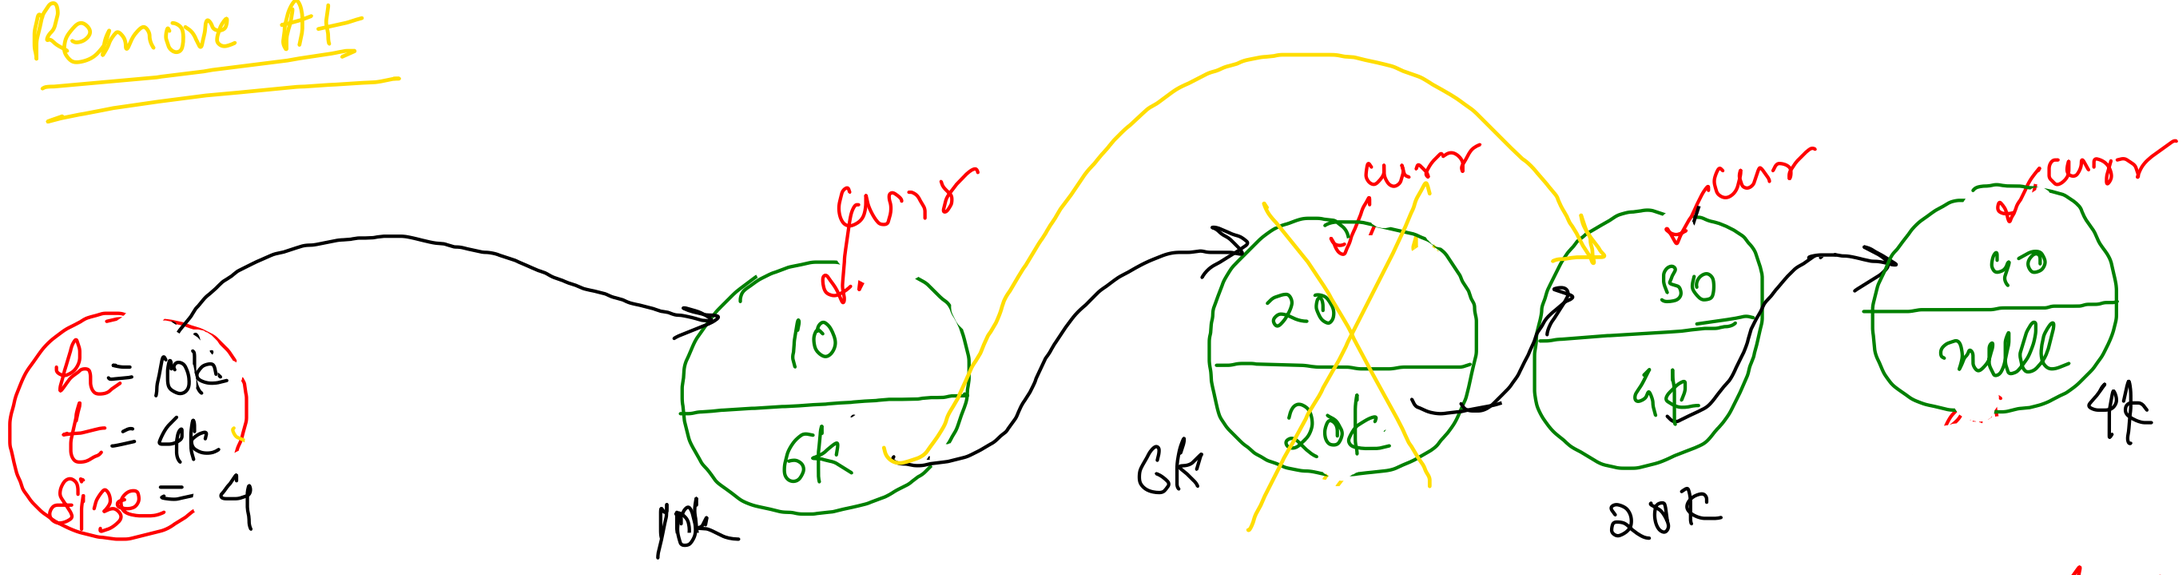
    if(size == 1){
        head = tail = null;
    } else {
        Node prevTail = head;
        for(int i=0; i<size-2; i++){
            prevTail = prevTail.next;
        }

        prevTail.next = null;
        tail = prevTail;
    }

    size--;
}
```

→ O(n)

Remove At



① removeAt(0) ⟶ removeFirst()

② removeAt(size-1) ⟶ removeLast()

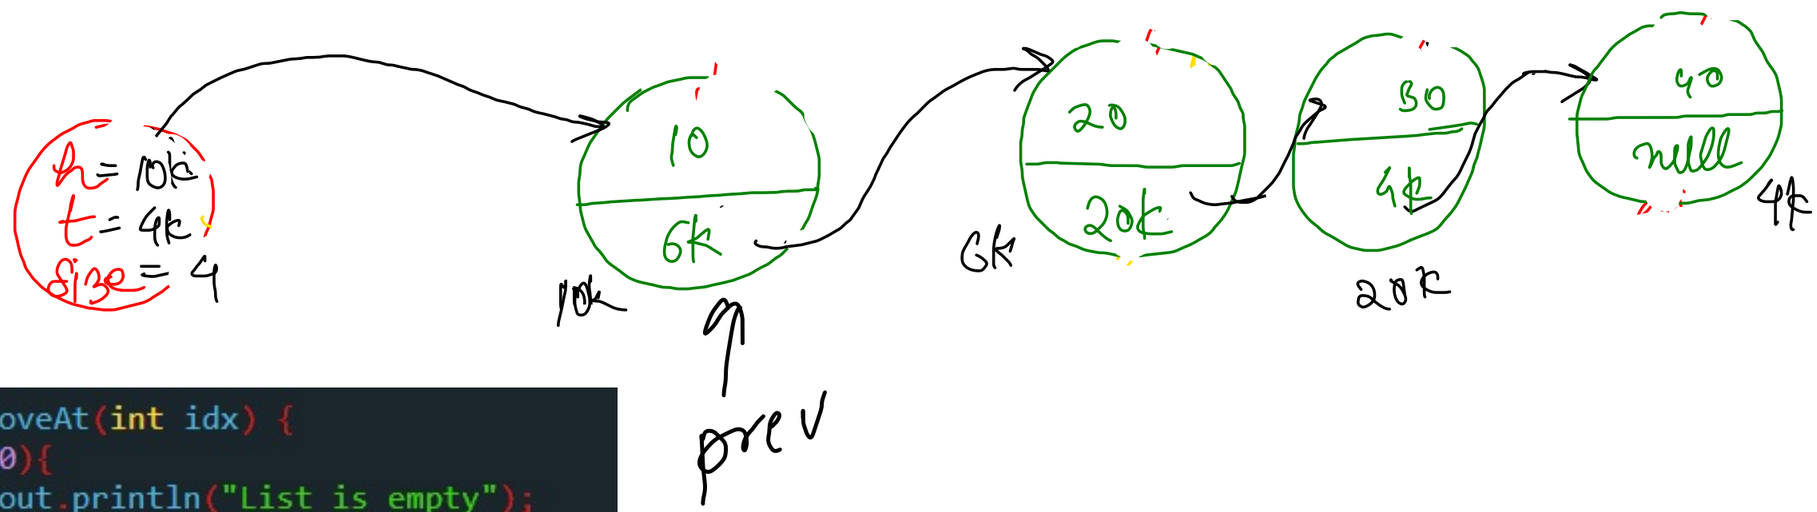
③ removeAt(idx) ⟶

{ 0 < idx < size-1 }

① Get idx-1 th node O(N)
② prev.next = prev.next.next
③ size--;

idx < -1 } invalid arg
idx >= size

size == 0 } List is empty



```java
public void removeAt(int idx) {
    if(size == 0){
        System.out.println("List is empty");
        return;
    }

    if(idx < 0 || idx >= size){
        System.out.println("Invalid arguments");
        return;
    }

    if(idx == 0) removeFirst();
    else if(idx == size - 1) removeLast();
    else {
        Node prev = head;
        for(int i=0; i<idx-1; i++){
            prev = prev.next;
        }

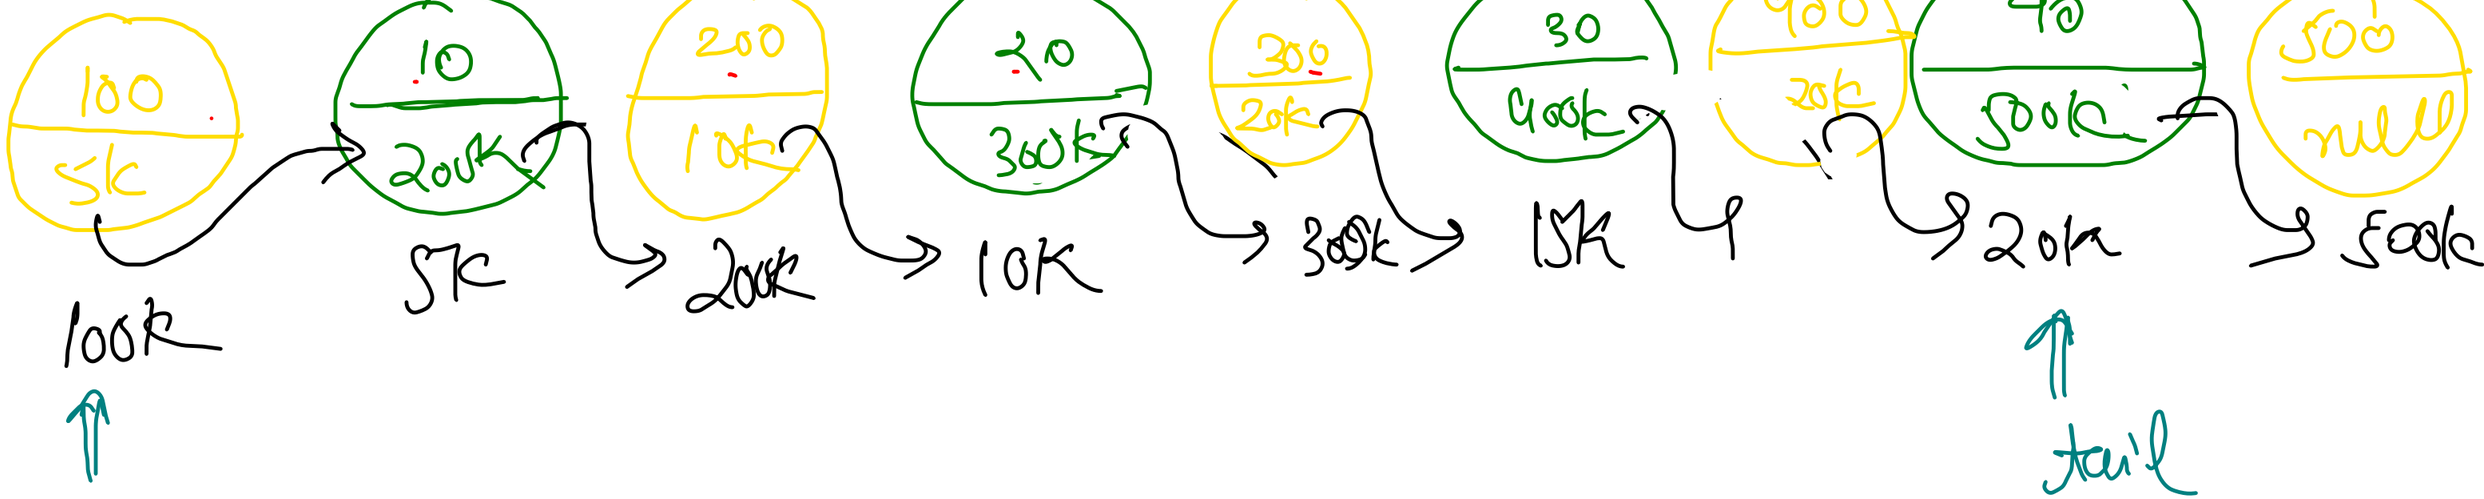
        prev.next = prev.next.next;
        size--;
    }
}
```

O(N) → In worst case

LL.removeAt(2)

Worst O(N)

Add At



head

AddAt(0, 100) ⇒ addFirst(100);

AddAt(2, 200)

AddAt(4, 300)

AddAt(6, 40) ⇒ Add at Second last

size-1

AddAt(8, 500) ⇒ AddLast

size

```java
public void addAt(int idx, int val){
    if(idx < 0 || idx > size){
        System.out.println("Invalid arguments");
        return;
    }

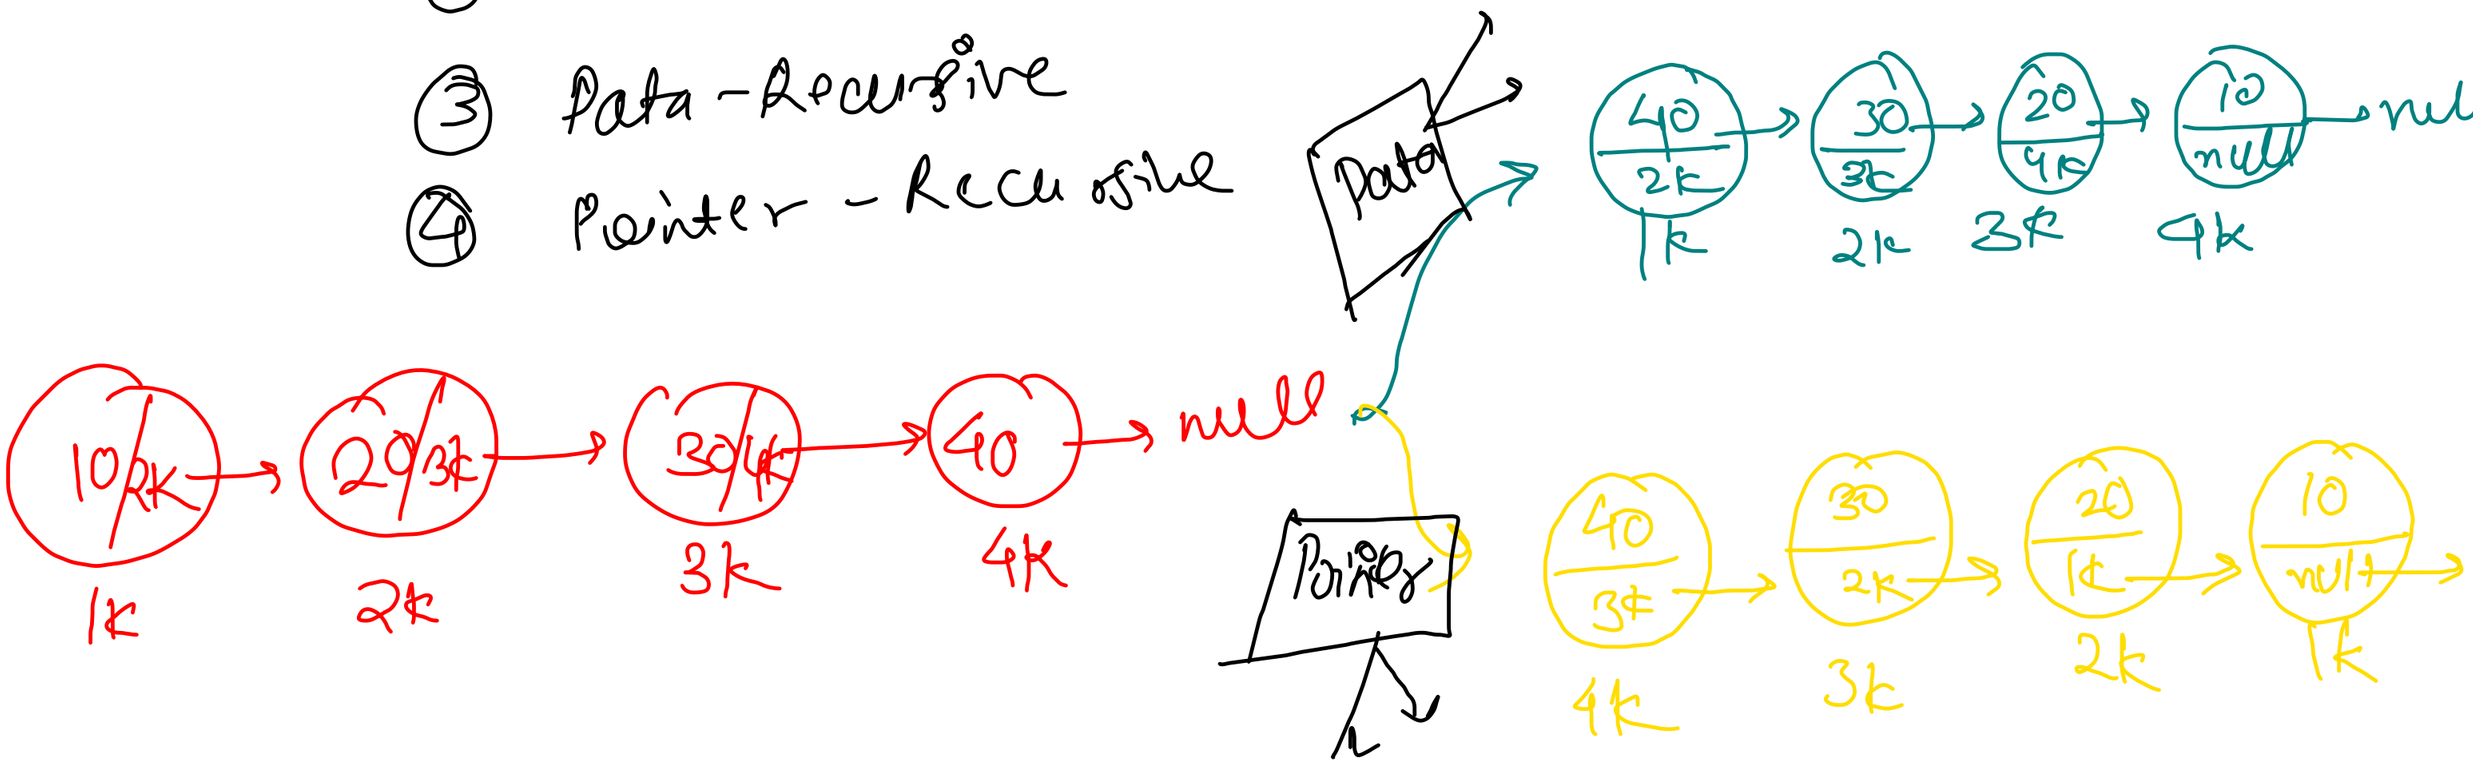
    if(idx == 0) addFirst(val);
    else if(idx == size) addLast(val);
    else {
        Node temp = new Node();
        temp.data = val;

        Node prev = head;
        for(int i=0; i<idx-1; i++){
            prev = prev.next;
        }

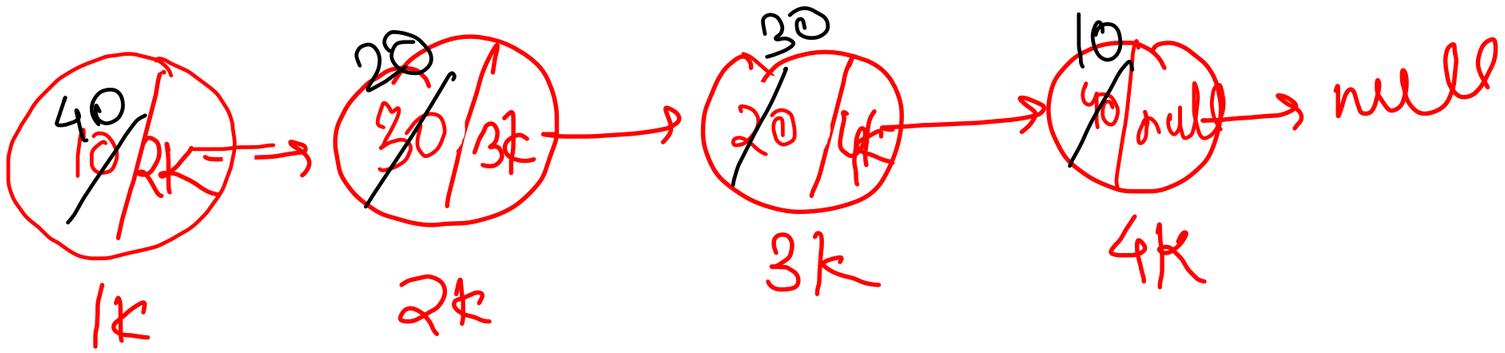
        temp.next = prev.next;
        prev.next = temp;
        size++;
    }
}
```

Reverse a linked list

- ① Data - Iterative
- ② Pointer - Iterative
- ③ Data - Recursive
- ④ Pointer - Recursive



Data Iterative



right left

```
while(left < right){
(1) leftNode = getNAt(0)
    rightNode = getNAt(n-1)
    ⇒ O(N)
    left++ right--

(2) left-N = getAt(1)
    rightN = getAt(n-2)
    ⇒ O(N)
}
```

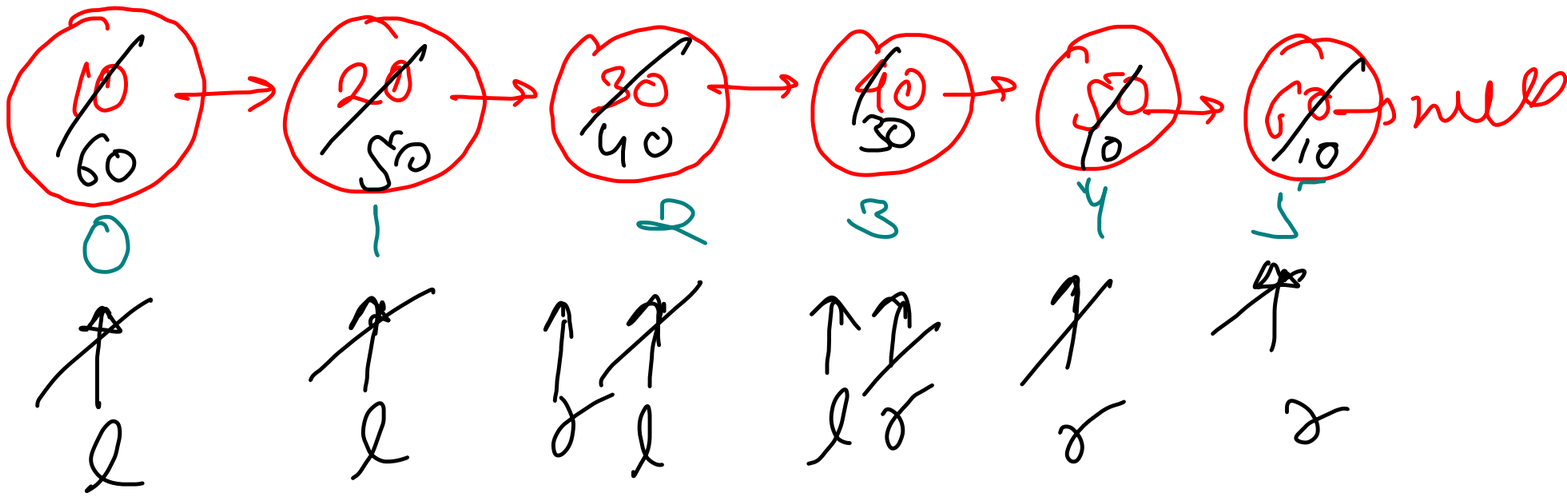
Time Comp ⇒ $\frac{N}{2} * O(N) = O(N^2)$

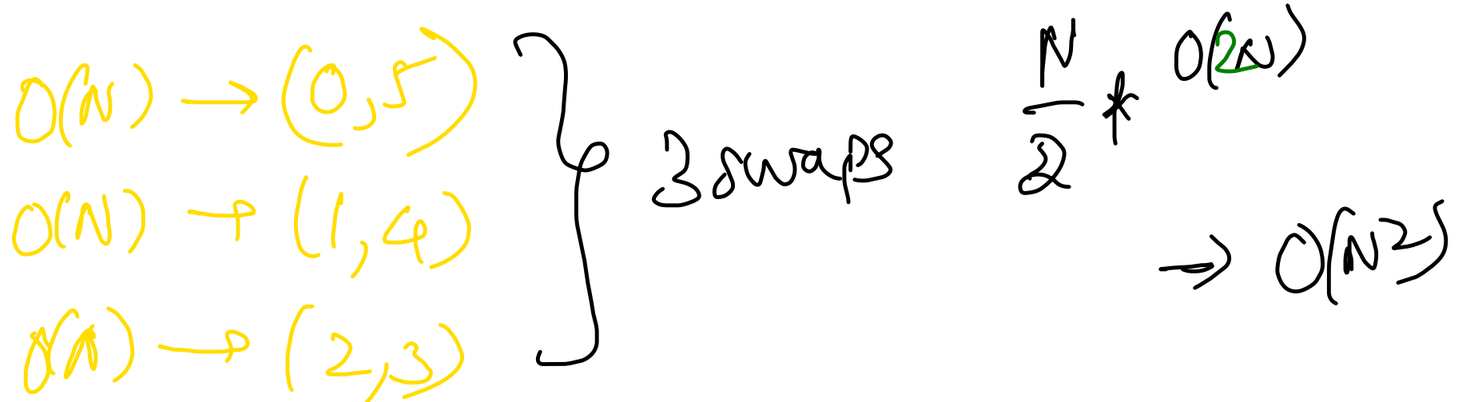
```java
public Node getNodeAt(int idx){
    Node curr = head;
    for(int i=0; i<idx; i++){
        curr = curr.next;
    }
    return curr;
}

public void swap(Node left, Node right){
    int leftData = left.data;
    left.data = right.data;
    right.data = leftData;
}

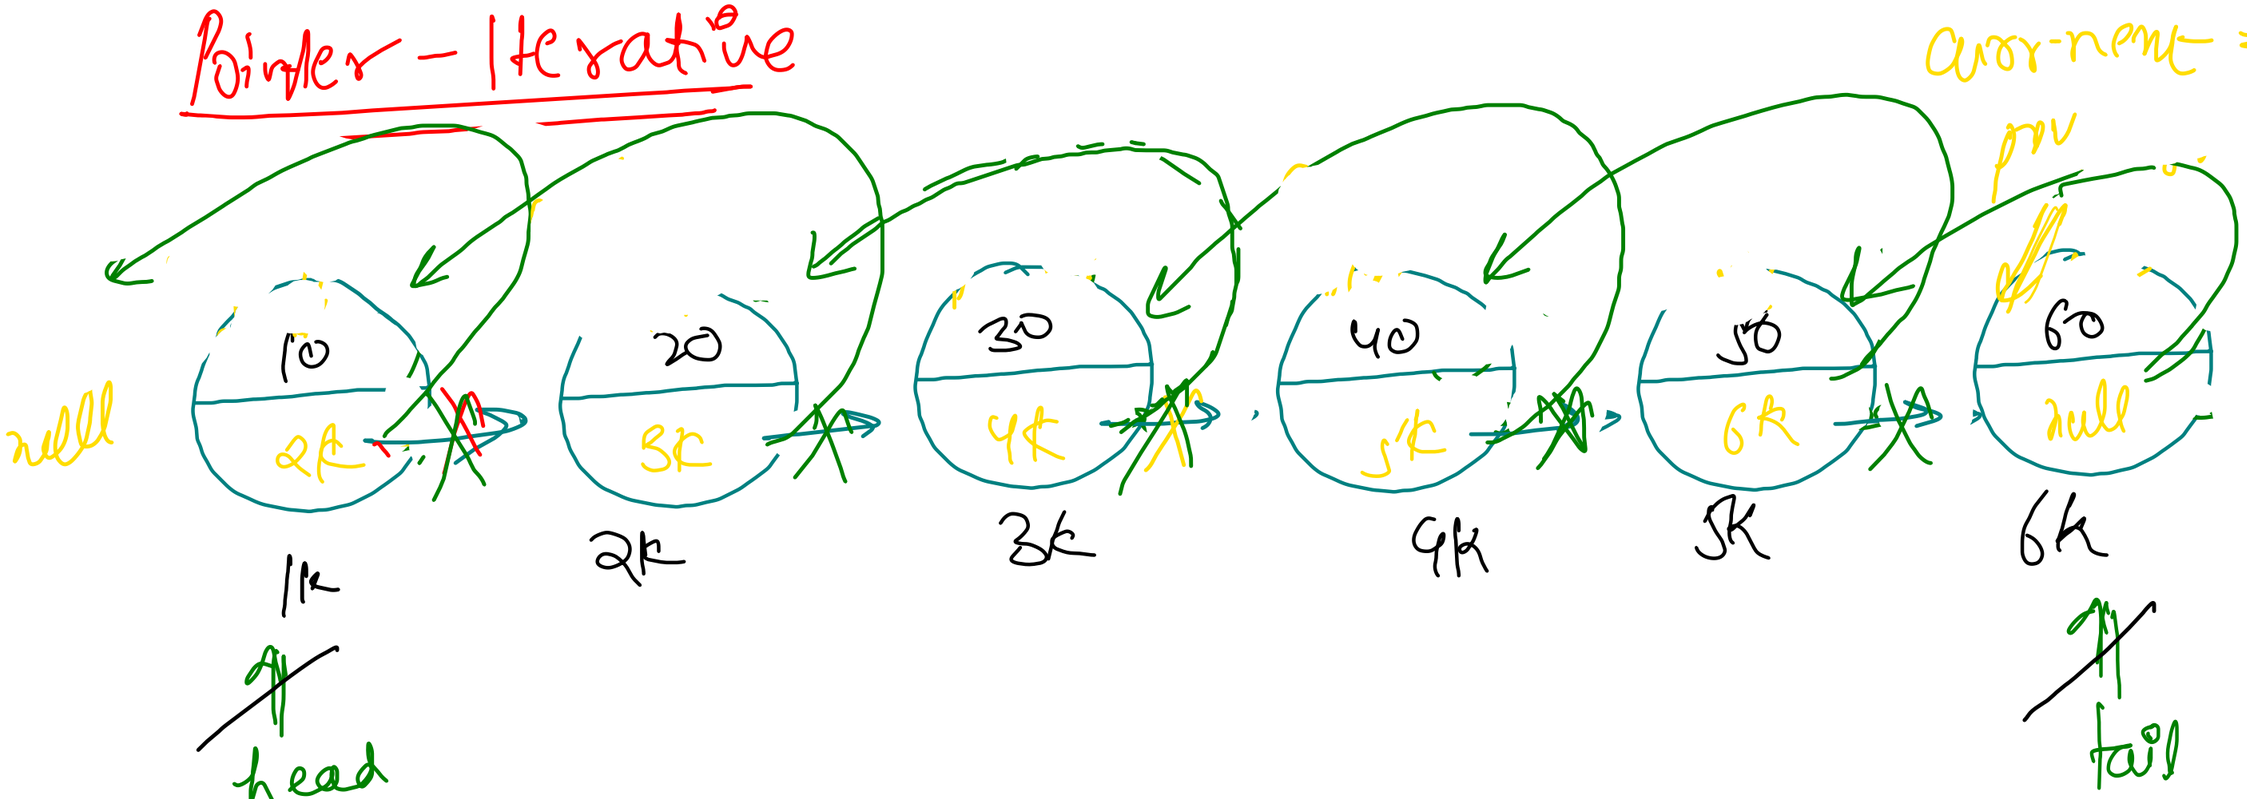
public void reverseDI() {
    int left = 0, right = size - 1;
    while(left < right){
        Node leftNode = getNodeAt(left);
        Node rightNode = getNodeAt(right);

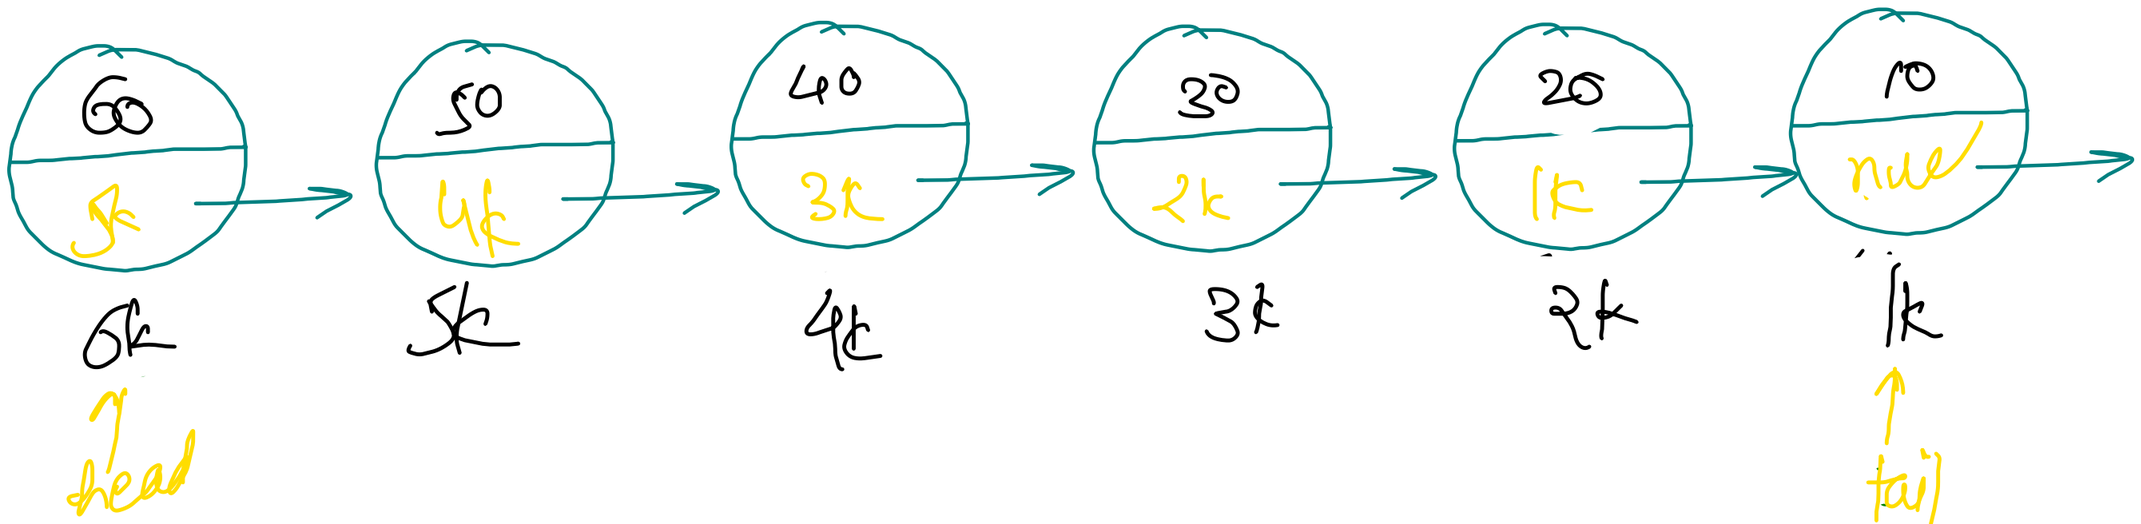
        swap(leftNode, rightNode);
        left++; right--;
    }
}
```





Pointer - Iterative

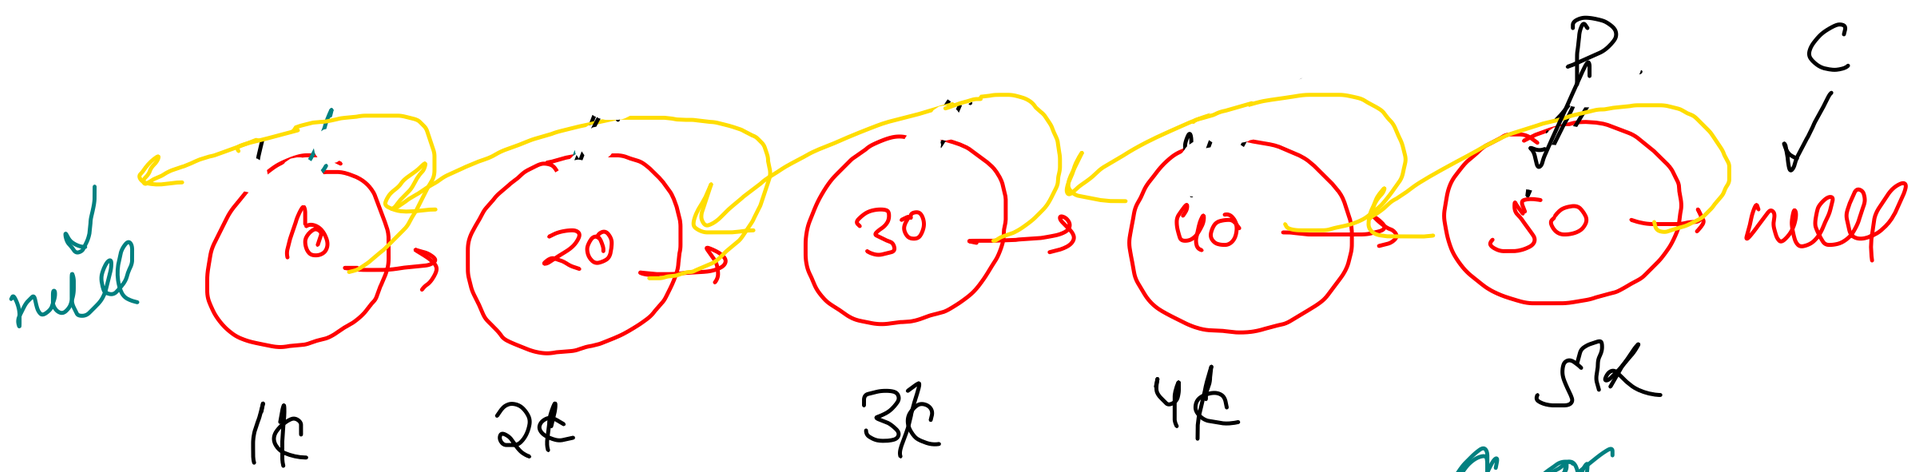




```
Node prev = null, curr = head;
while (curr != null) {
    Node ahead = curr.next;
    curr.next = prev;
    prev = curr; curr = ahead;
}
```

swap (head, tail)

1. Even
2. Odd
3. 1 Node
4. 0 Node

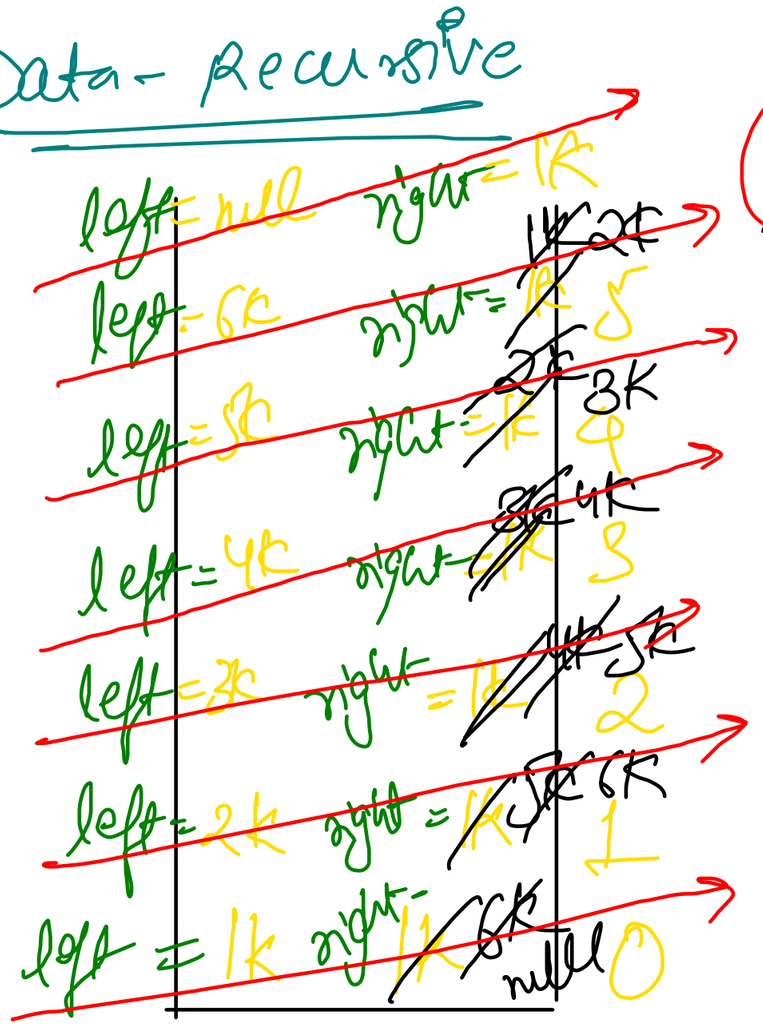


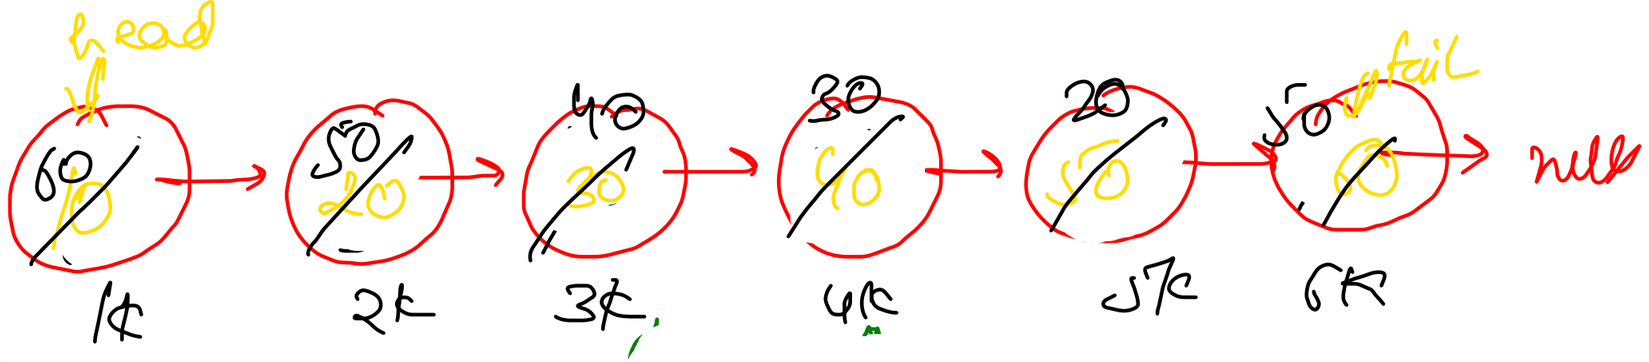
```java
public void reversePI(){
    Node prev = null;
    Node curr = head;

    while(curr != null){
        Node ahead = curr.next;
        curr.next = prev;
        prev = curr;
        curr = ahead;
    }

    Node temp = head;
    head = tail;
    tail = temp;
}
```

Data - Recursive





$$(1)^n + (k+\phi) * n = \boxed{O(n)}$$

```java
public Node reverseDR(Node left, Node right, int counter){
    if(left == null){
        return right;
    }

}
```

```
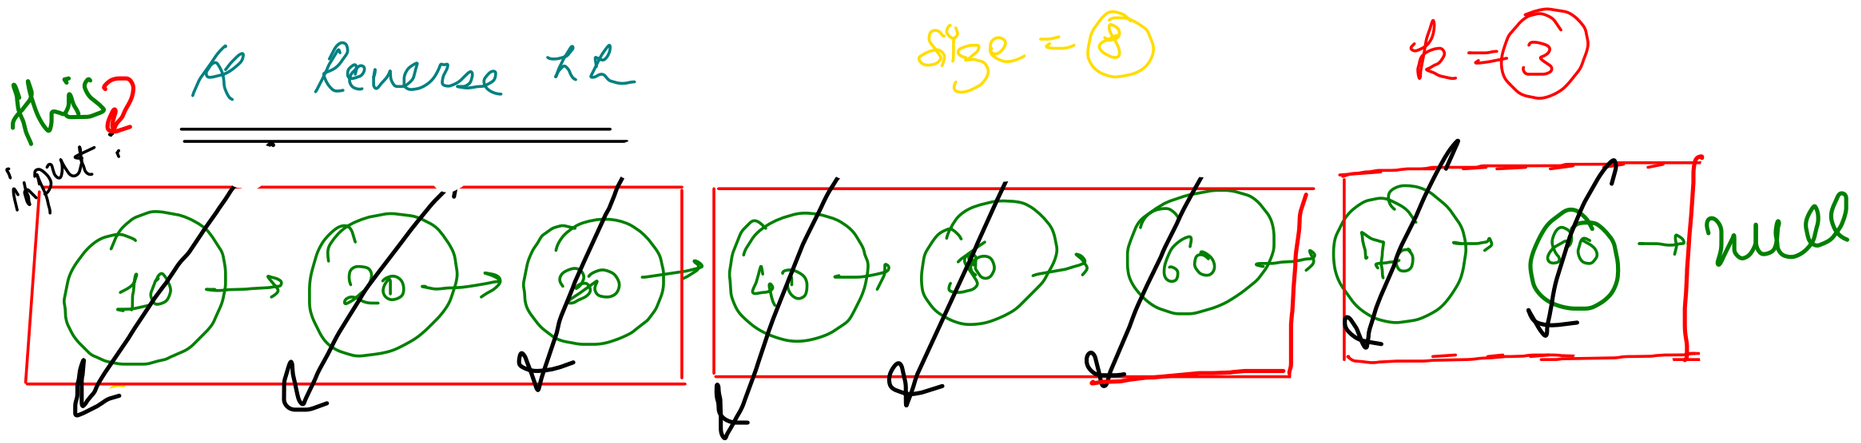
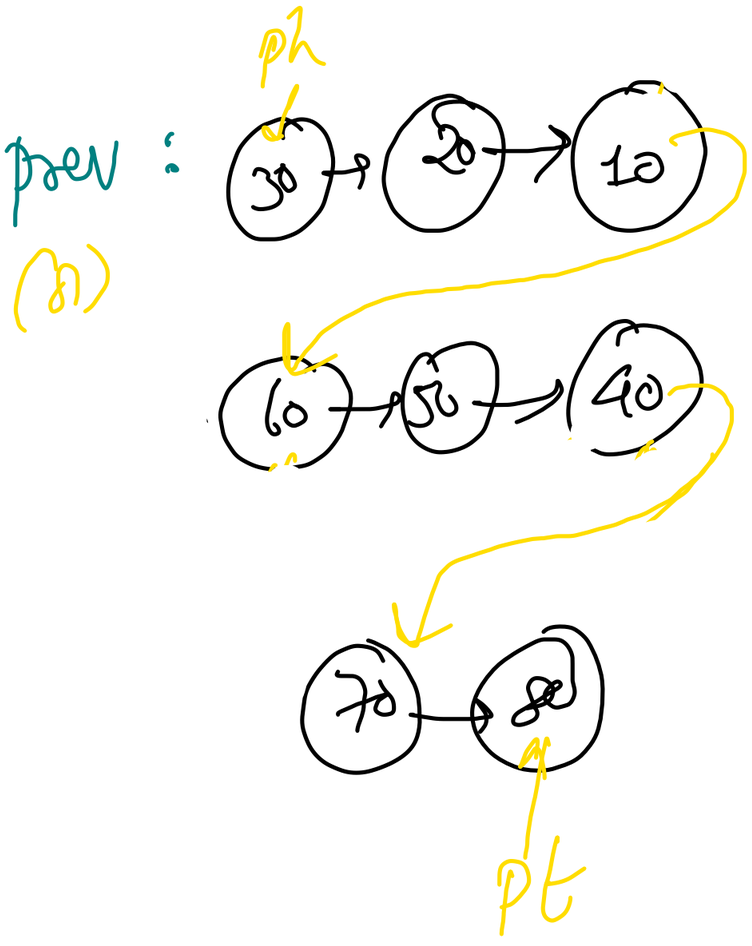
public void reversePR(){
    Node curr = head;
    reversePRHelper(curr);

    // swap head and tail
    Node temp = head;
    head = tail;
    tail = temp;

    // make tail's node next as null
    tail.next = null;
}
```





```
LinkedList prev = new LinkedList();

while(size > 0){
    LinkedList curr = new LinkedList();

    if(size < k){
        // if group is partially filled
        while(size > 0){
            int val = head.data;
            this.removeFirst();
            curr.addLast(val);
        }
    }

    else {
        // extracting a group of size k
        for(int i=0; i<k; i++){
            int val = head.data;
            this.removeFirst();
            curr.addFirst(val);
        }
    }

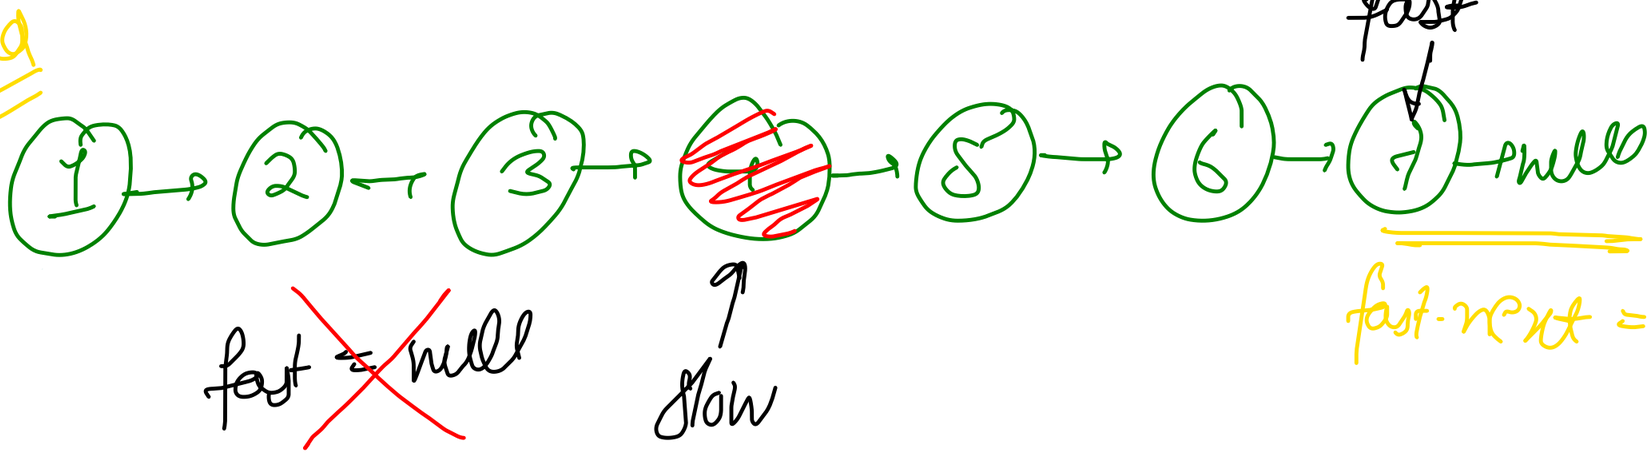
    if(prev.head == null){
        // when we have extracted our first group (30, 20, 10)
        prev = curr;
    } else {
        // adding one group of size k in the prev linked list
        prev.tail.next = curr.head;
        prev.tail = curr.tail;
        prev.size += curr.size;
    }
}

prev.tail.next = null;
this.head = prev.head;
this.tail = prev.tail;
this.size = prev.size;
```

876 LC

Middle Linked List { Hare & Tortoise } { Two pointer }

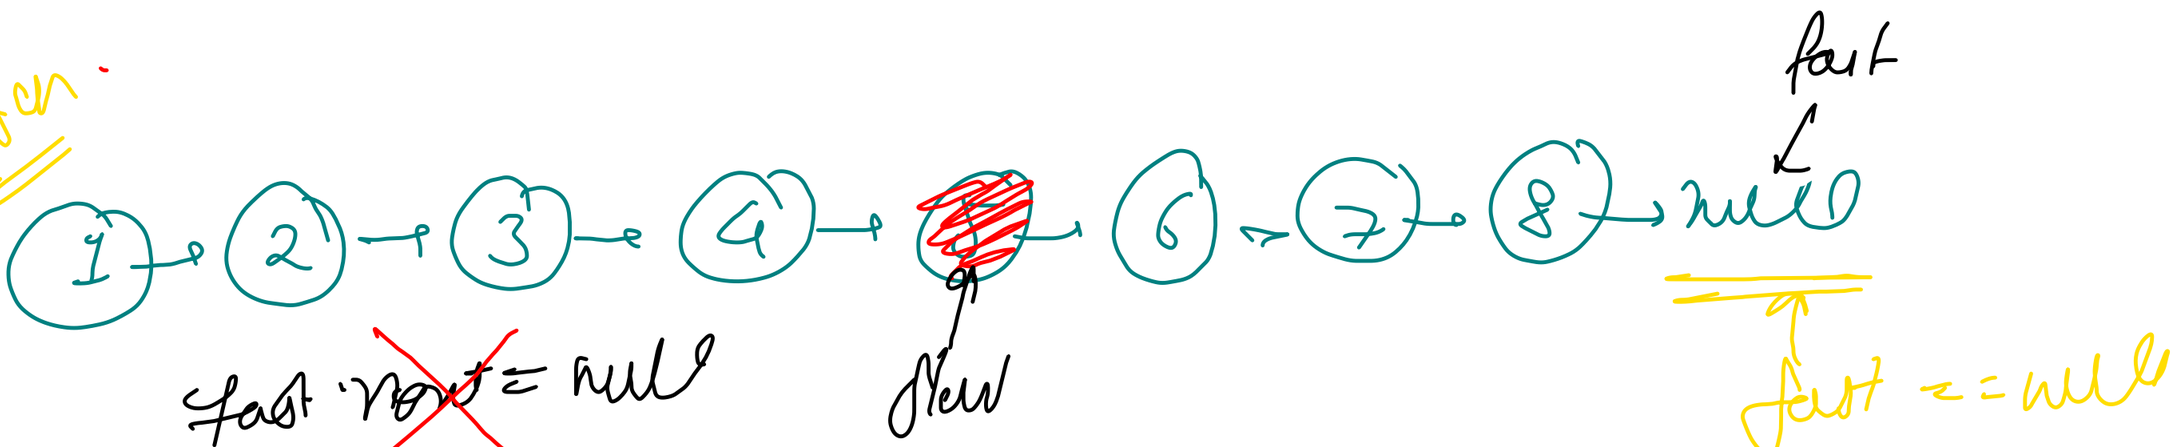
odd



① Two traversal

get (size/2) + 1

even



O(N)

```java
public ListNode reverse(ListNode head){
    ListNode prev = null, curr = head;
    while(curr != null){
        ListNode ahead = curr.next;
        curr.next = prev;
        prev = curr;
        curr = ahead;
    }
    return prev;
}
```

O(N)

```java
public ListNode middle(ListNode head){
    ListNode slow = head, fast = head;
    ListNode prev = null;

    while(fast != null && fast.next != null){
        prev = slow;
        slow = slow.next;
        fast = fast.next.next;
    }

    if(fast == null) // even
        return prev;
    return slow;
}
```

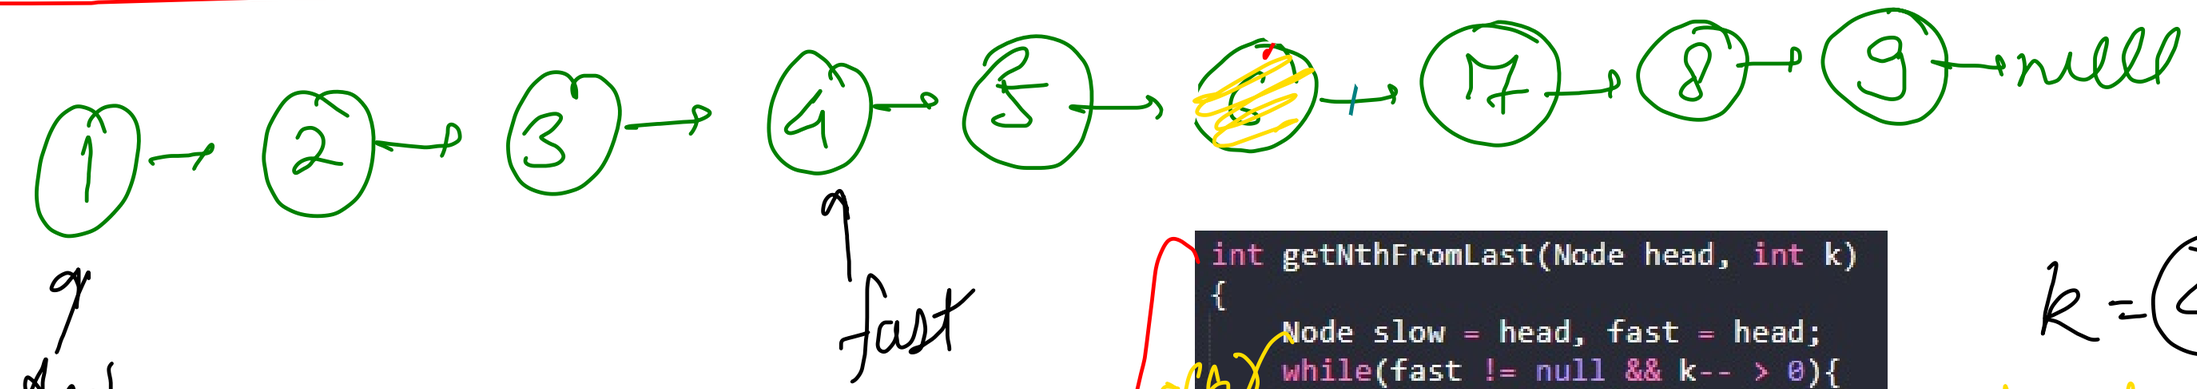
O(N)

```java
public boolean isPalindrome(ListNode head) {
    if(head == null || head.next == null){
        return true;
    }

    ListNode mid = middle(head);
    ListNode second = reverse(mid.next);

    while(head != null && second != null){
        if(head.val != second.val) return false;
        head = head.next;
        second = second.next;
    }
    return true;
}
```

Kth Node from End



```
int getNthFromLast(Node head, int k)
{
    Node slow = head, fast = head;
    while(fast != null && k-- > 0){
        fast = fast.next;
    }

    if(k > 0) return -1;

    while(fast != null){
        slow = slow.next;
        fast = fast.next;
    }

    return slow.data;
}
```

O(N)

O(K)

O(N-K)

corner case
k > N

k = 4

total = 9 = N

1st Appr : 2 Traversal

→ count No of nodes in LL ⇒ N

→ get(N - k)
9 - 4

2nd Appr : Single traversal
{ Two pointer }

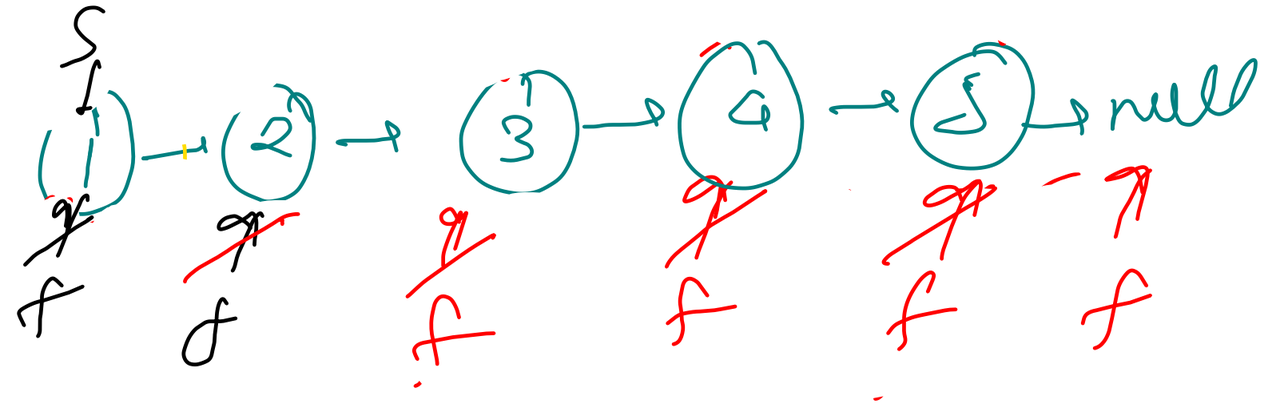
```java
int getNthFromLast(Node head, int k)
{
    Node slow = head, fast = head;
    while(fast != null && k-- > 0){
        fast = fast.next;
    }

    if(k > 0) return -1;

    while(fast != null){
        slow = slow.next;
        fast = fast.next;
    }

    return slow.data;
}
```

Maintain diff



k = 5 4 3 2 1 0 ⇒ 1

Both fast became null & k = 0 together

k = 1 0 ⇒ 5 → k became 0

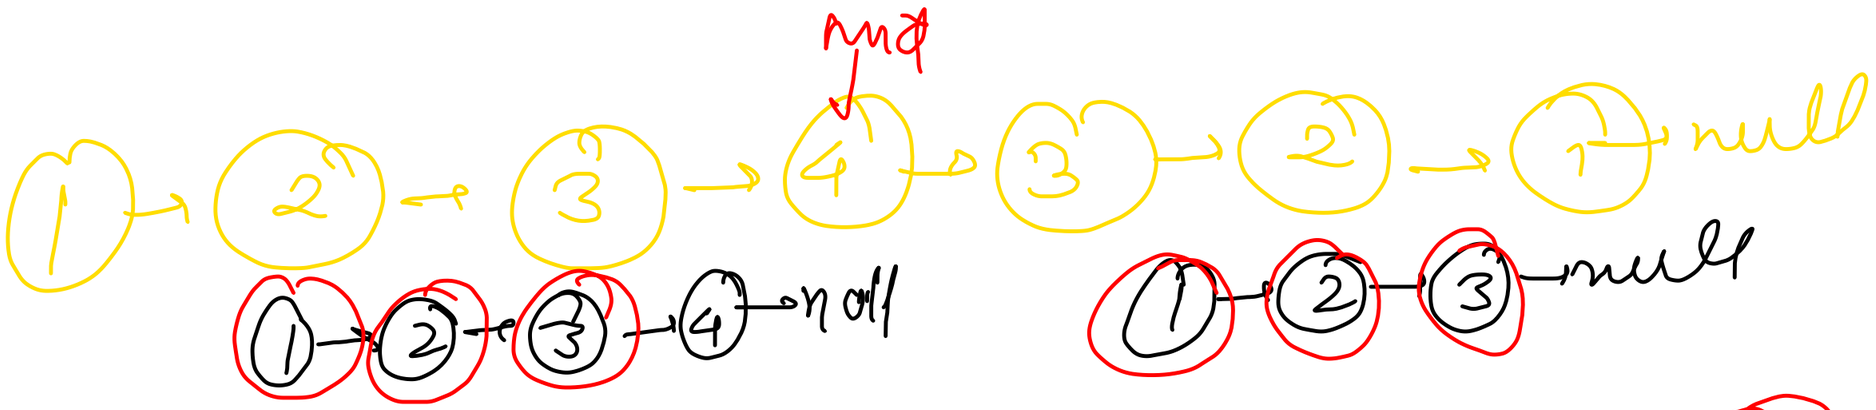
k = 6 5 4 3 2 1 ⇒ -1

⇒ only fast became null

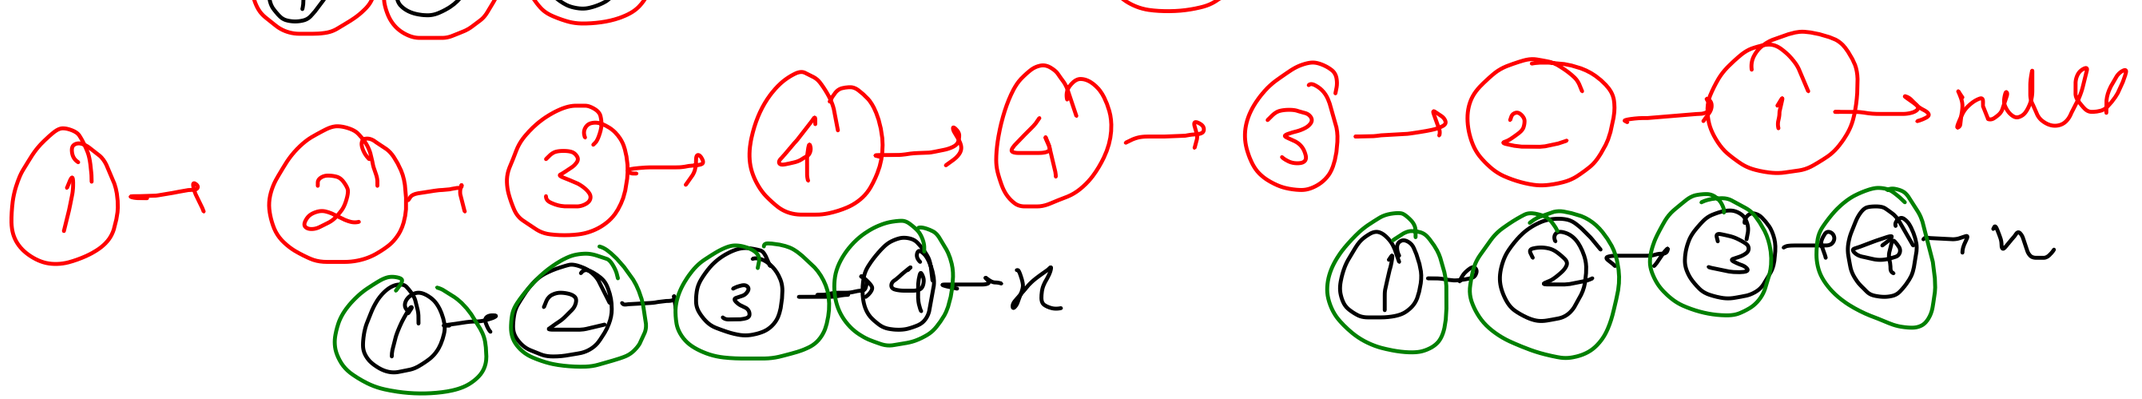
Palindrome ll

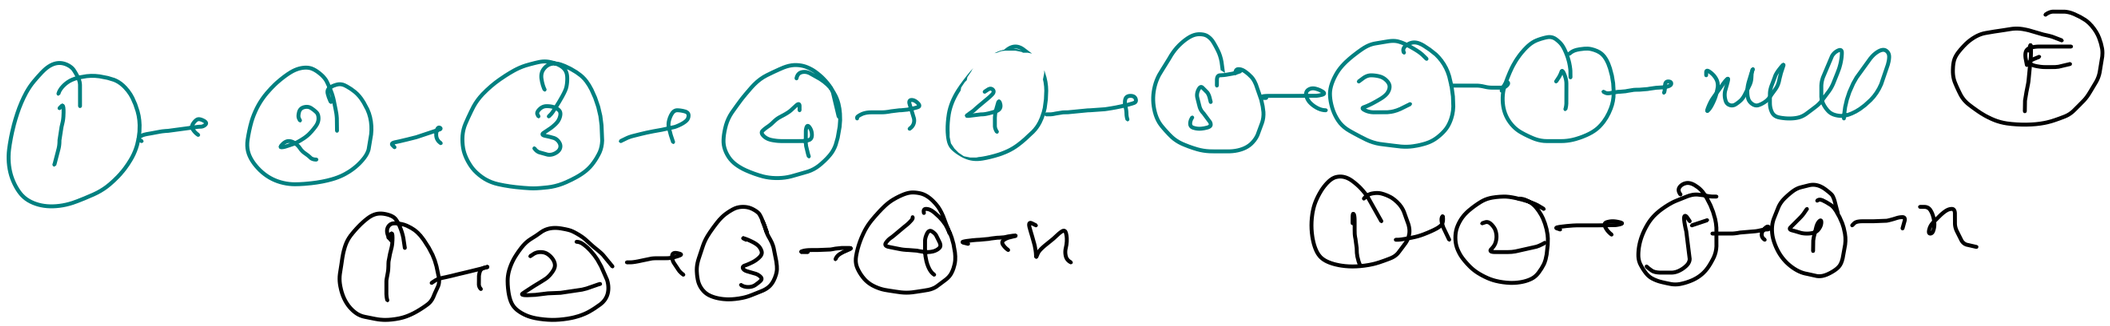
HINT → Reverse LL
→ Middle of ll

Odd:



Even





Approach

(1) Find Middle node

(2) Reverse the 2nd part

(3) Compare both the parts
- ↳ equal → Palindrome (T)
- ↳ Palindrome (F)

O(N)

```java
public ListNode reverse(ListNode head){
    ListNode prev = null, curr = head;
    while(curr != null){
        ListNode ahead = curr.next;
        curr.next = prev;
        prev = curr;
        curr = ahead;
    }
    return prev;
}
```

Pointer Iterative

O(N)

```java
public ListNode middle(ListNode head){
    ListNode slow = head, fast = head;
    ListNode prev = null;

    while(fast != null && fast.next != null){
        prev = slow;
        slow = slow.next;
        fast = fast.next.next;
    }

    if(fast == null) // even
        return prev;
    return slow;
}
```

even → first mid
Odd → single mid

O(N)

```java
public boolean isPalindrome(ListNode head) {
    if(head == null || head.next == null){
        return true;
    }

    ListNode mid = middle(head);
    ListNode second = reverse(mid.next);

    while(head != null && second != null){
        if(head.val != second.val) return false;
        head = head.next;
        second = second.next;
    }
    return true;
}
```

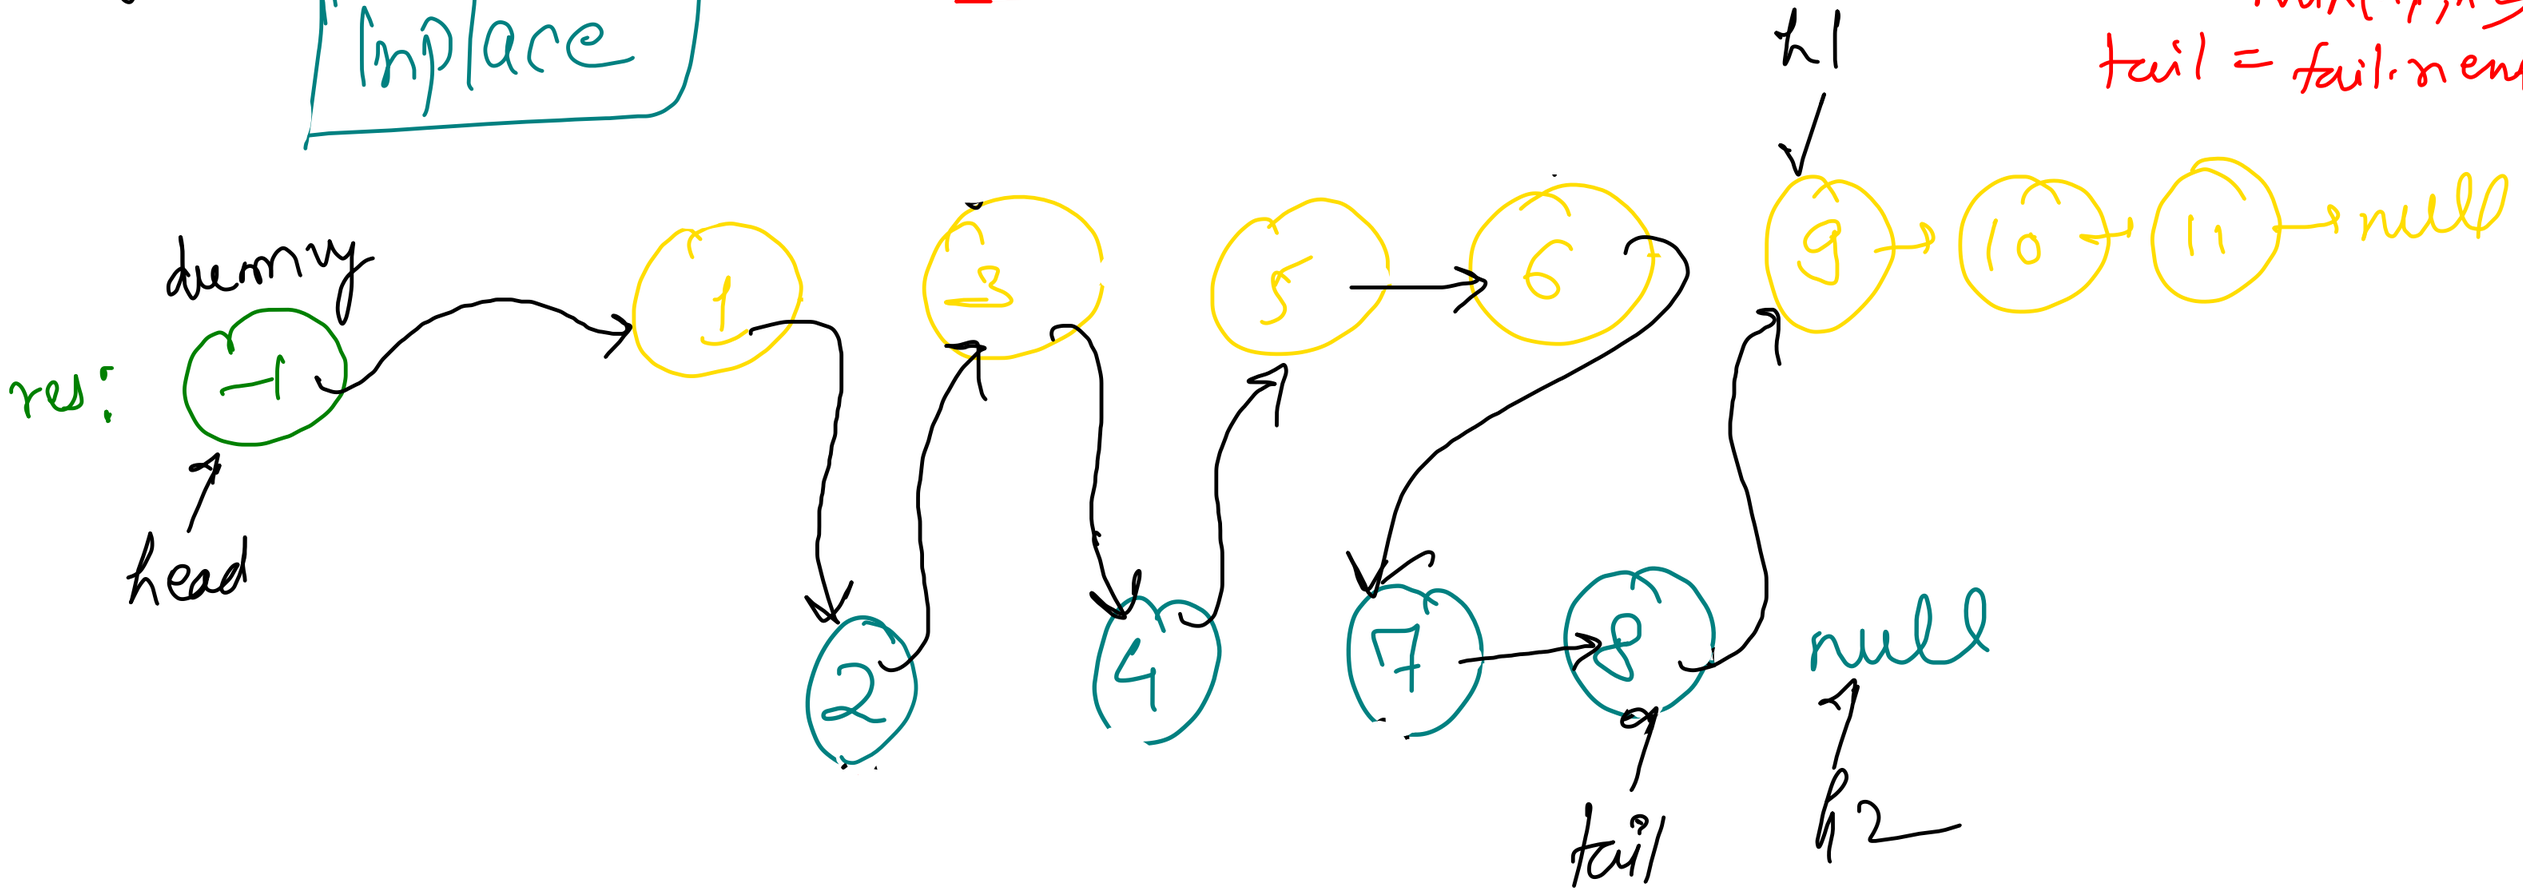
Corner Case

Merge 2 sorted lls

Inplace

O(N+M)

tail.next = min(h1, h2)
tail = tail.next



```
Node sortedMerge(Node head1, Node head2) {
    Node dummy = new Node(-1);
    Node head = dummy, tail = dummy;

    while(head1 != null && head2 != null){
        if(head1.data < head2.data){
            tail.next = head1;
            head1 = head1.next;
        }
        else{
            tail.next = head2;
            head2 = head2.next;
        }
        tail = tail.next;
    }

    if(head1 != null) tail.next = head1;
    else tail.next = head2;

    return dummy.next;
}
```

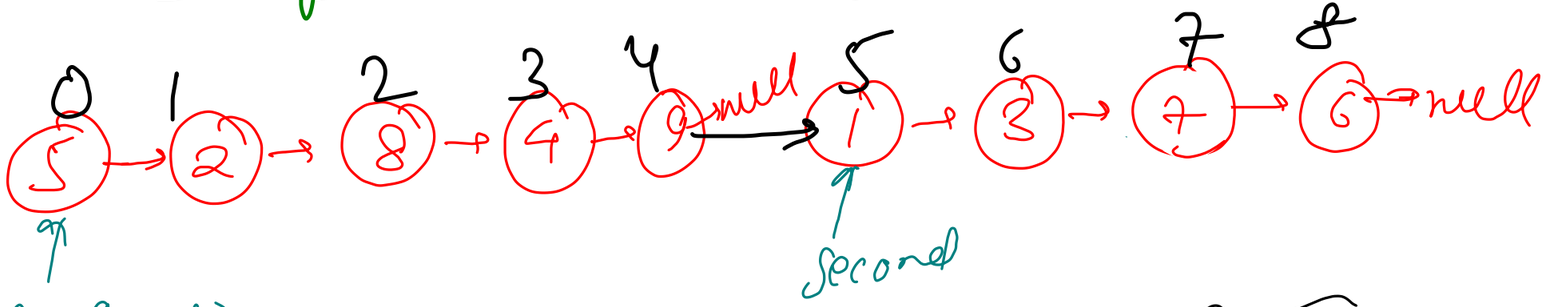
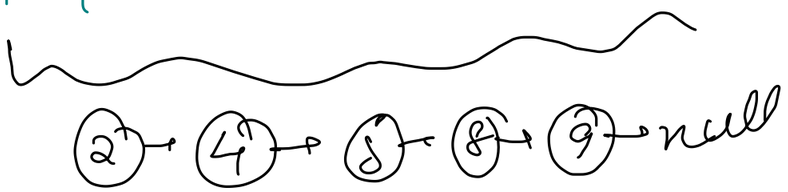
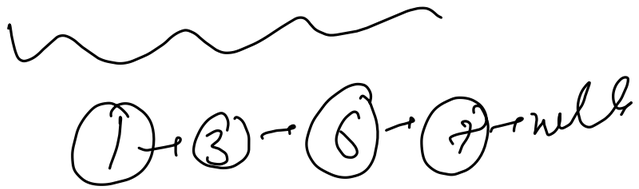
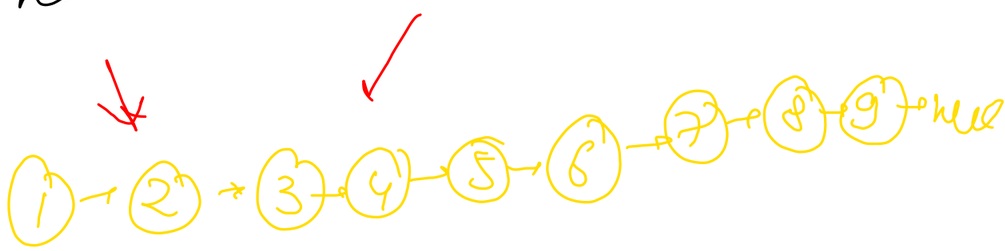
$T(1) = 2T(0) + \frac{k}{k}*n) * 2^{\log_2 k}$

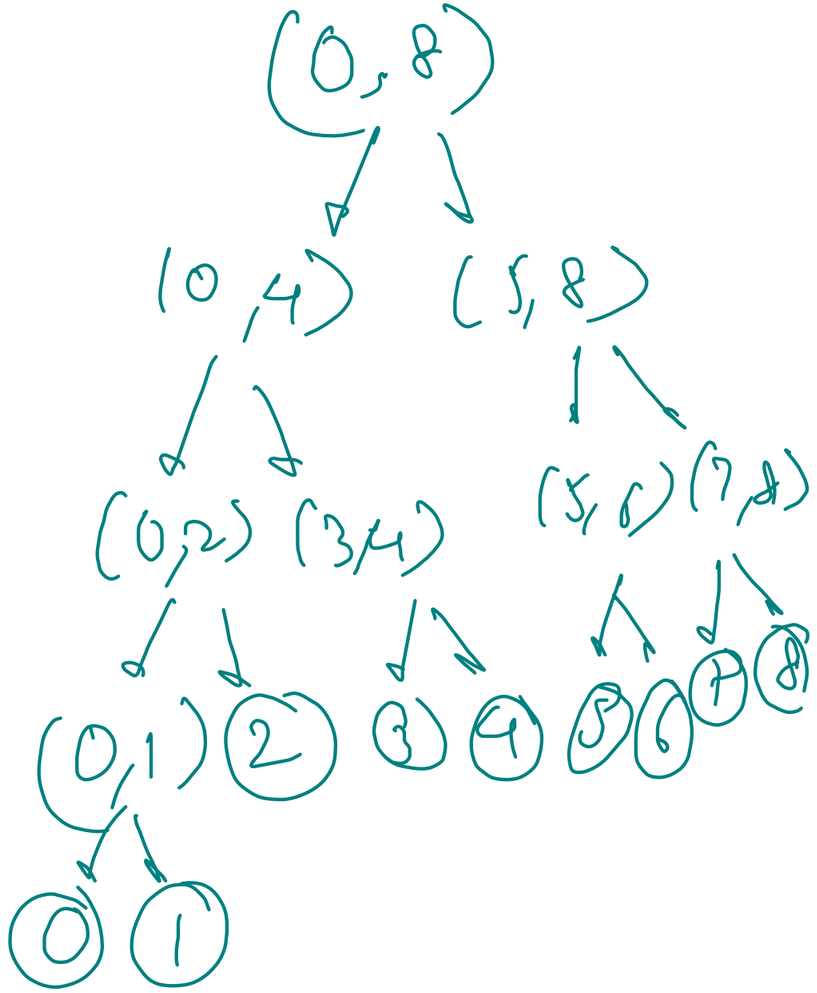
Merge Sort LL {14 LC}











Approach

MergeSort(LL) →

(1) Find middle & break LL into 2 parts

(2) mergeSort(left)
mergeSort(right)

(3) Merge & Return

```java
public ListNode middle(ListNode head){
    ListNode slow = head, fast = head;
    ListNode prev = null;

    while(fast != null && fast.next != null){
        prev = slow;
        slow = slow.next;
        fast = fast.next.next;
    }

    if(fast == null) // even
        return prev;
    return slow; // odd
}
```

```java
ListNode merge2list(ListNode head1, ListNode head2) {⟺}

public ListNode sortList(ListNode head) {
   if(head == null || head.next == null){
        return head;
    }

    ListNode mid = middle(head);
    ListNode midNext = mid.next;
    mid.next = null;

    ListNode left = sortList(head);
    ListNode right = sortList(midNext);
    return merge2list(left, right);
}
```

mergeSort → $T(n) = O(n) + 2T(n/2) + O(n)$

middle → $O(n)$

Recursive calls → $2T(n/2)$

merge → $O(n)$

$T(n) = 2T(n/2) + 2*O(n)$ ⋮ → $O(n \log_2 n)$

MS on LL = MS on Array (in Time Comp.)

Why merge sort is preferred for linked list
and quick sort is preferred for arrays.

TC: O(nlogn) SC: O(1)

merge Sort on LL

T(N) → O(nlogn)

Space → inplace

Recursion call
Stack ⇒ O($\log_2 n$)

merge 2 List
is inplace

→ Big-Integers

→ Add 2 th

→ Subtract 2 th

→ Multiply 2 th

int

$2^{31}-1$

$\approx 10^9$

Long

$2^{63}-1$

$\approx 10^{18}$

Addition of 2 LL

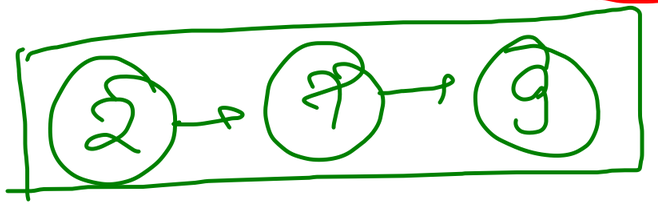
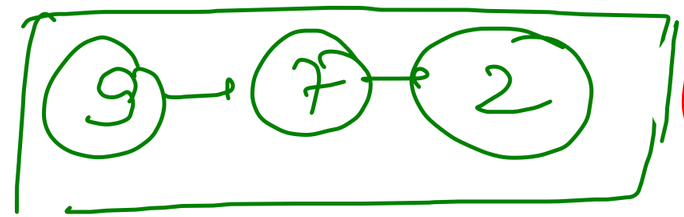
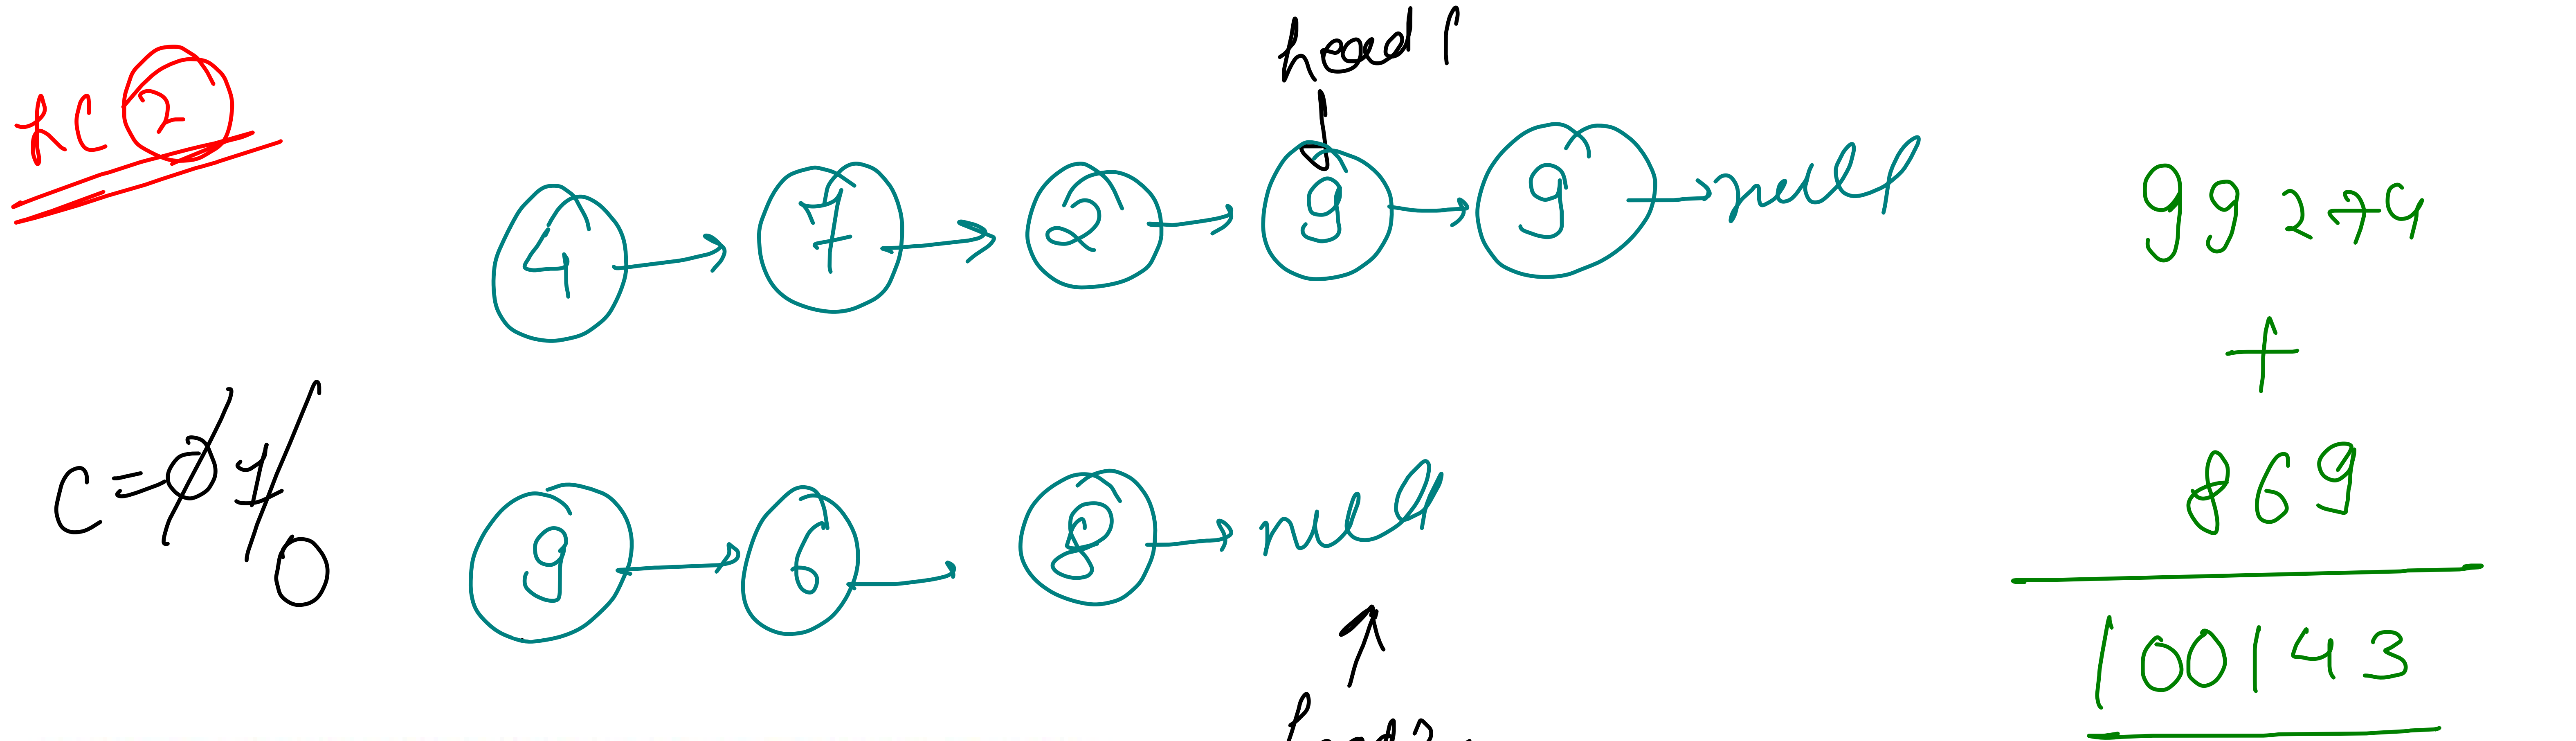
972



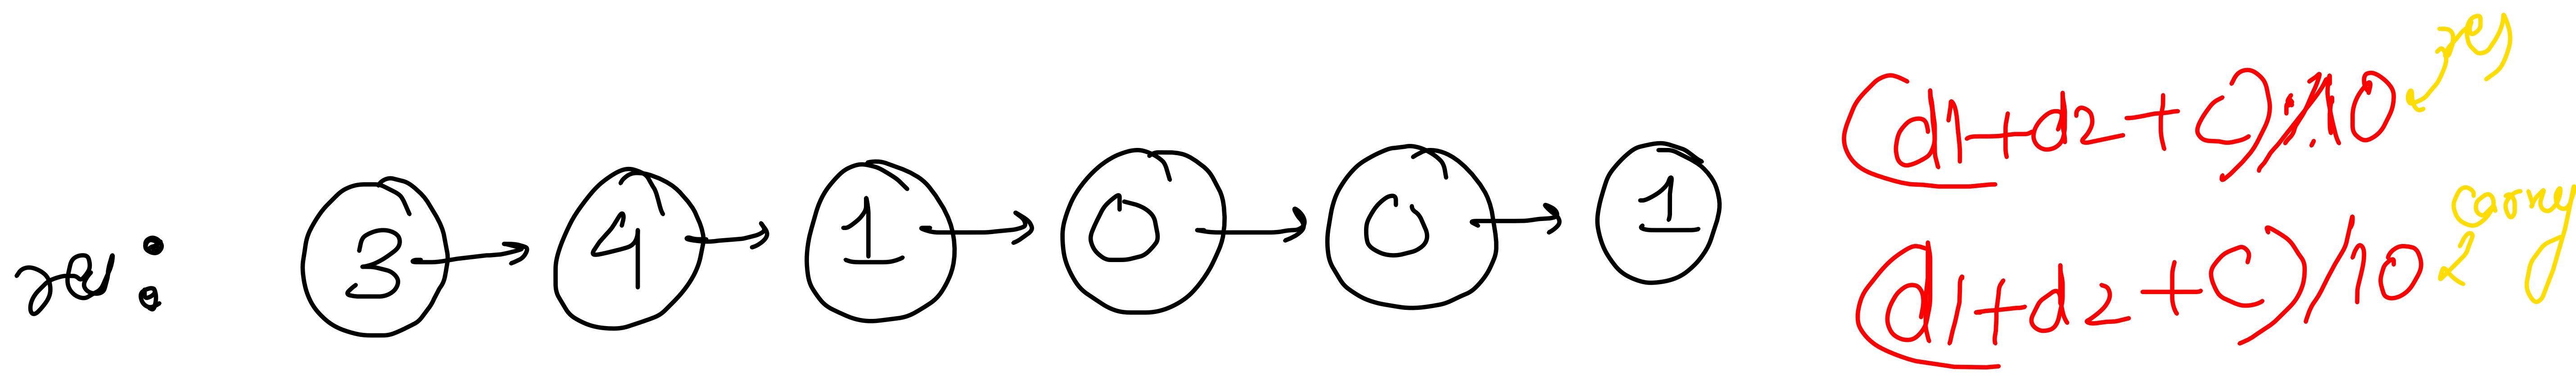
(LC 2)



(LC 445)



The digits are stored in **reverse order**.



```java
public ListNode addTwoNumbers(ListNode l1, ListNode l2) {
    ListNode dummy = new ListNode(-1);
    ListNode head = dummy, tail = dummy;

    int carry = 0;
    while(l1 != null || l2 != null || carry > 0){
        int d1 = (l1 == null) ? 0 : l1.val;
        int d2 = (l2 == null) ? 0 : l2.val;

        ListNode temp = new ListNode((d1 + d2 + carry) % 10);
        carry = (d1 + d2 + carry) / 10;

        tail.next = temp;
        tail = temp;
        if(l1 != null) l1 = l1.next;
        if(l2 != null) l2 = l2.next;
    }

    return dummy.next;
}
```

Getting Started

LC 445

```java
public ListNode addTwoNumbers(ListNode l1, ListNode l2) {
    l1 = reverse(l1);
    l2 = reverse(l2);

    ListNode dummy = new ListNode(-1);
    ListNode head = dummy, tail = dummy;

    int carry = 0;
    while(l1 != null || l2 != null || carry > 0){
        int d1 = (l1 == null) ? 0 : l1.val;
        int d2 = (l2 == null) ? 0 : l2.val;

        ListNode temp = new ListNode((d1 + d2 + carry) % 10);
        carry = (d1 + d2 + carry) / 10;

        tail.next = temp;
        tail = temp;
        if(l1 != null) l1 = l1.next;
        if(l2 != null) l2 = l2.next;
    }

    return reverse(dummy.next);
}
```

```java
public ListNode reverse(ListNode head){
    ListNode prev = null, curr = head;
    while(curr != null){
        ListNode ahead = curr.next;
        curr.next = prev;
        prev = curr;
        curr = ahead;
    }
    return prev;
}
```

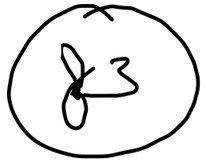
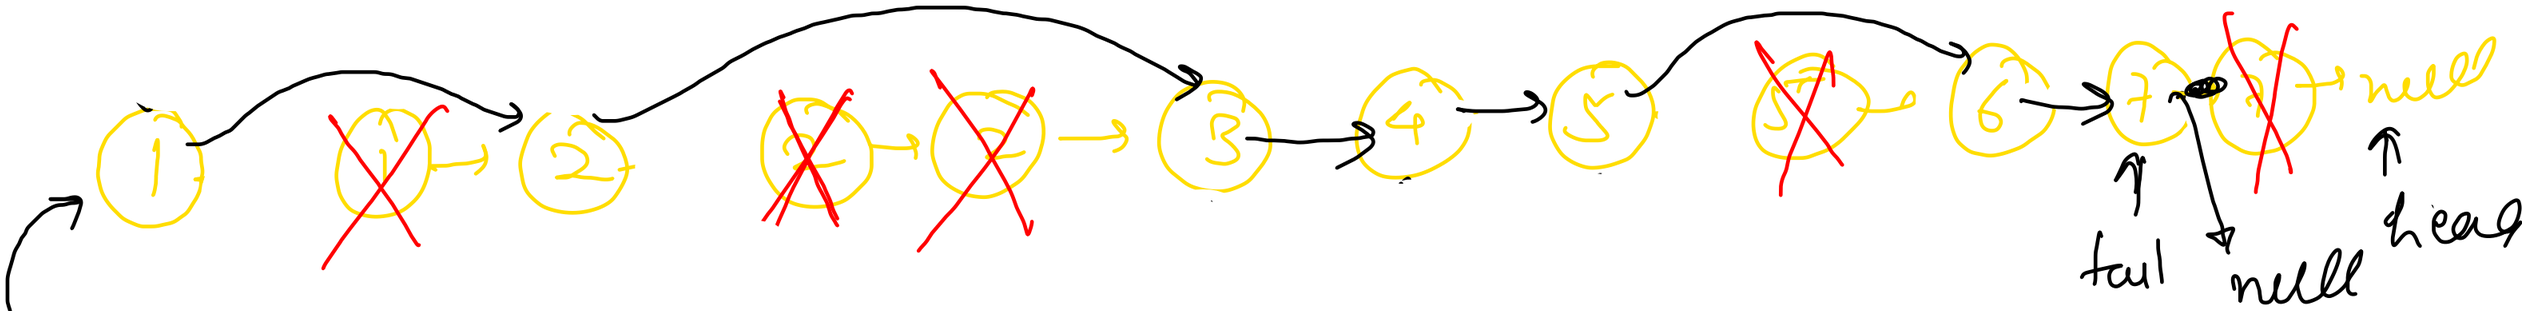
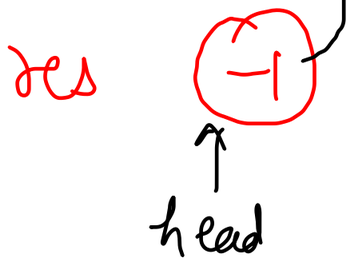
Remove Duplicates



Sorted LL ⇒ All occurency are consecutive





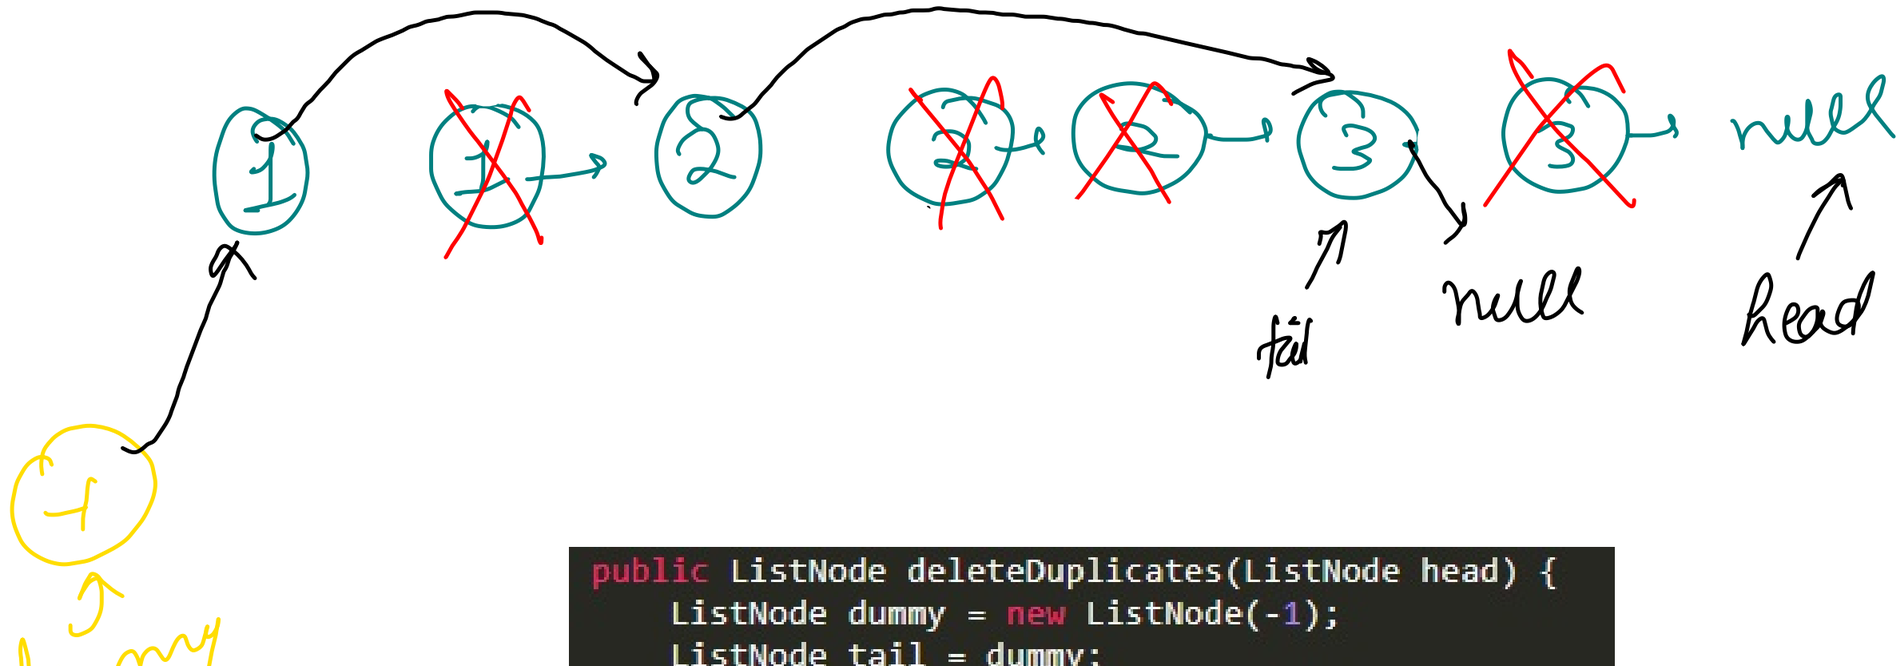
O(1) extra space

```java
public ListNode deleteDuplicates(ListNode head) {
    ListNode dummy = new ListNode(-1);
    ListNode tail = dummy;

    while(head != null){
        if(tail == dummy || head.val != tail.val){
            tail.next = head;
            tail = head;
        }
        head = head.next;
    }

    tail.next = null;
    return dummy.next;
}
```

O(N) Time Complexity

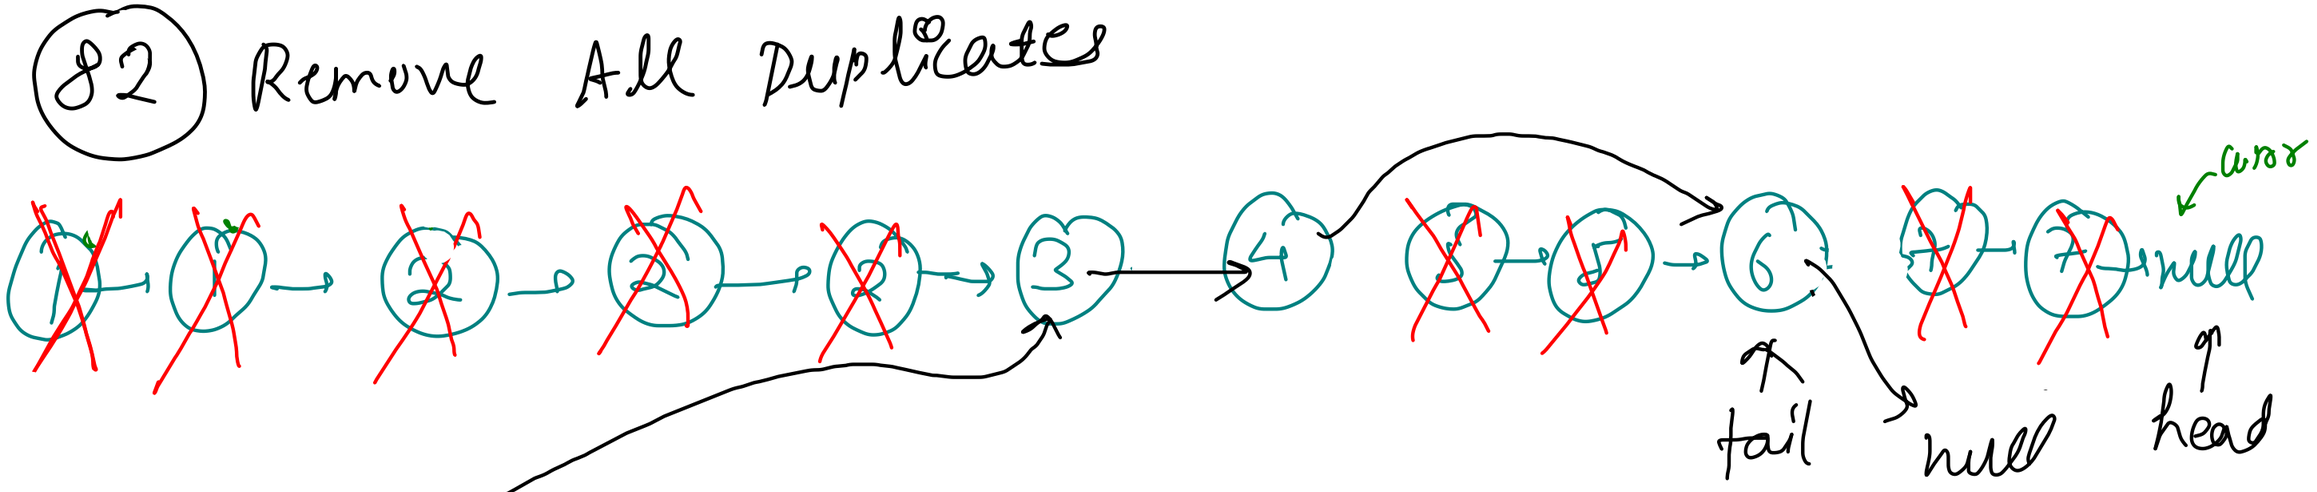


```java
public ListNode deleteDuplicates(ListNode head) {
    ListNode dummy = new ListNode(-1);
    ListNode tail = dummy;

    while(head != null){
        if(tail == dummy || head.val != tail.val){
            tail.next = head;
            tail = head;
        }
        head = head.next;
    }

    tail.next = null;
    return dummy.next;
}
```

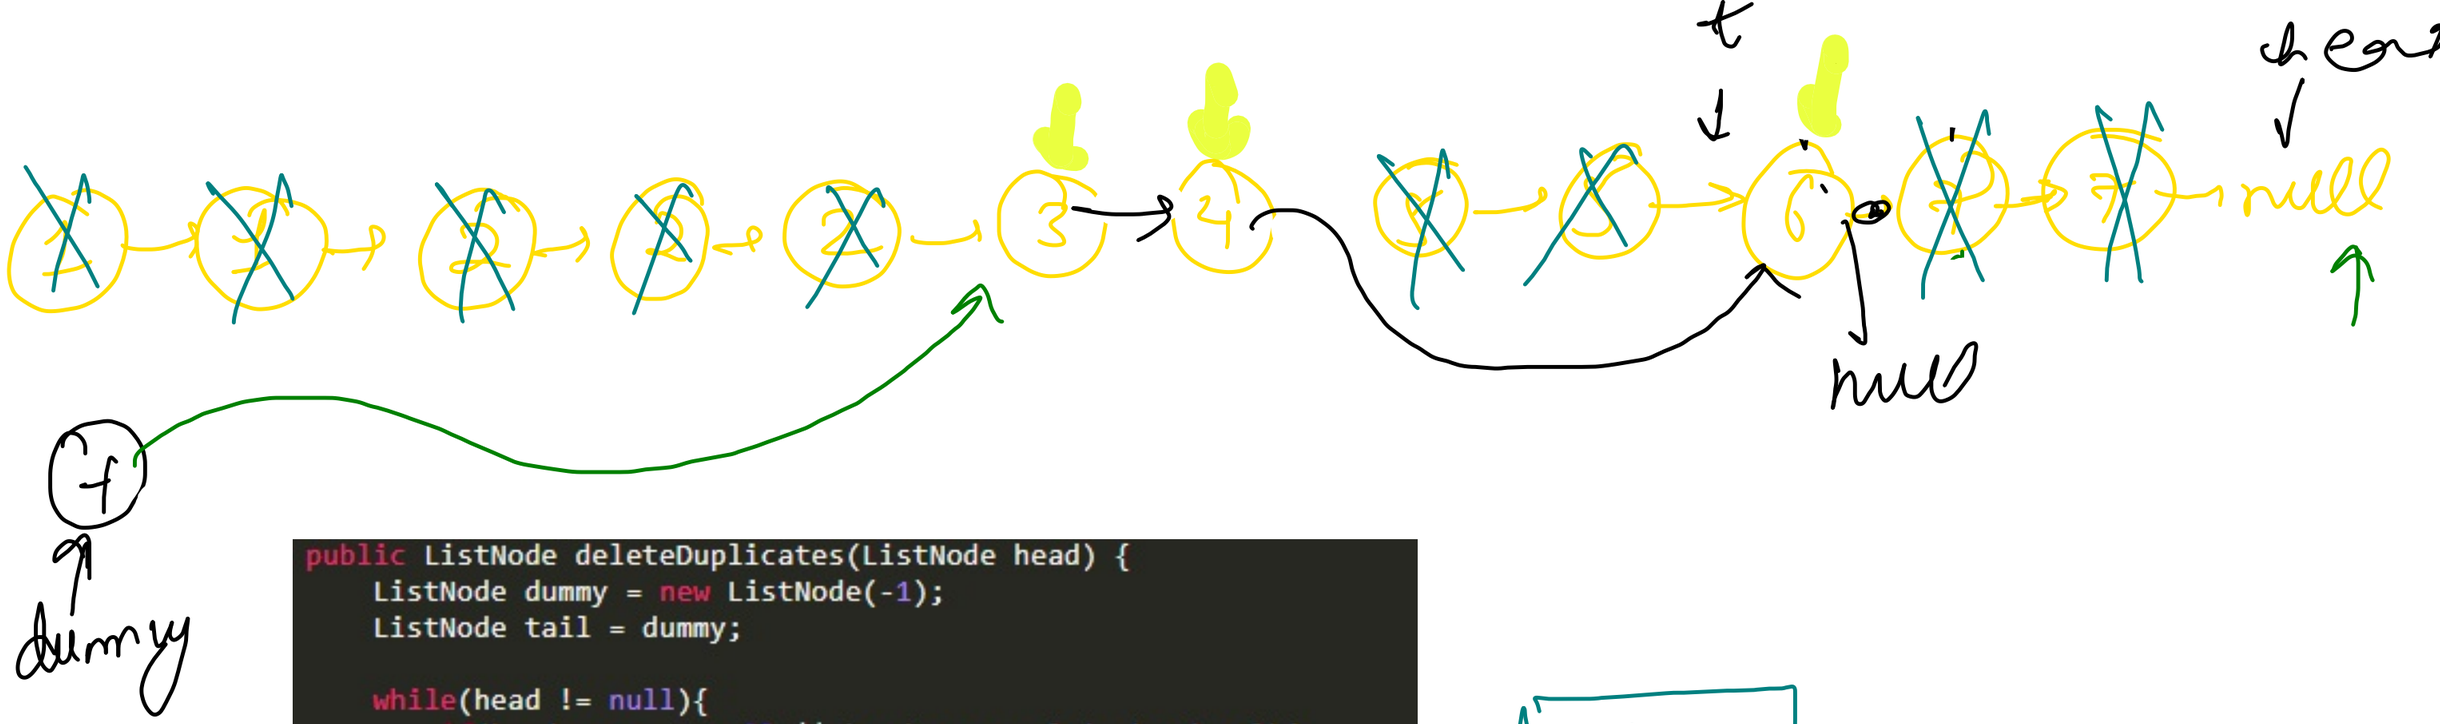
82 Remove All Duplicates



```java
public ListNode deleteDuplicates(ListNode head) {
    ListNode dummy = new ListNode(-1);
    ListNode tail = dummy;

    while(head != null){
        if(head.next == null || head.next.val != head.val){
            // single occurence
            tail.next = head;
            tail = head;
            head = head.next;
        } else {
            // delete all occurences of head.val inclusing head
            ListNode curr = head;
            while(curr != null && curr.val == head.val){
                curr = curr.next;
            }
            head = curr;
        }
    }

    tail.next = null;
    return dummy.next;
}
```



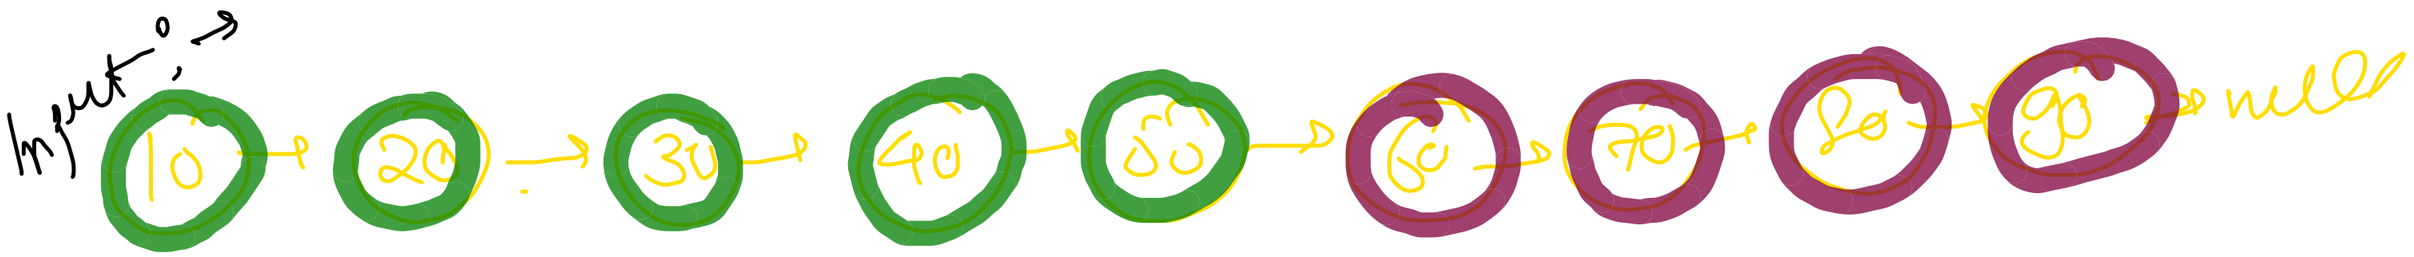
```java
public ListNode deleteDuplicates(ListNode head) {
    ListNode dummy = new ListNode(-1);
    ListNode tail = dummy;

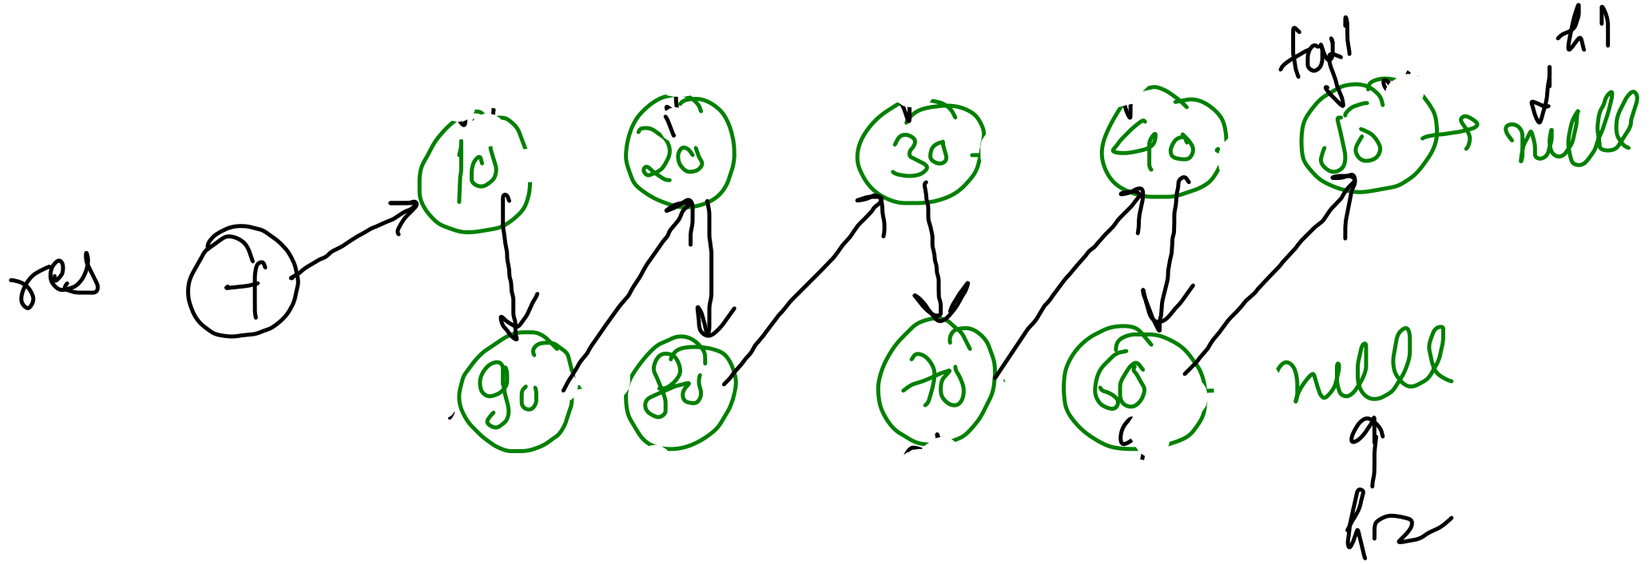
    while(head != null){
        if(head.next == null || head.next.val != head.val){
            // single occurence
            tail.next = head;
            tail = head;
            head = head.next;
        } else {
            // delete all occurences of head.val inclusing head
            ListNode curr = head;
            while(curr != null && curr.val == head.val){
                curr = curr.next;
            }
            head = curr;
        }
    }

    tail.next = null;
    return dummy.next;
}
```

Fold of LL { Reorder list: 143 }

WHY?

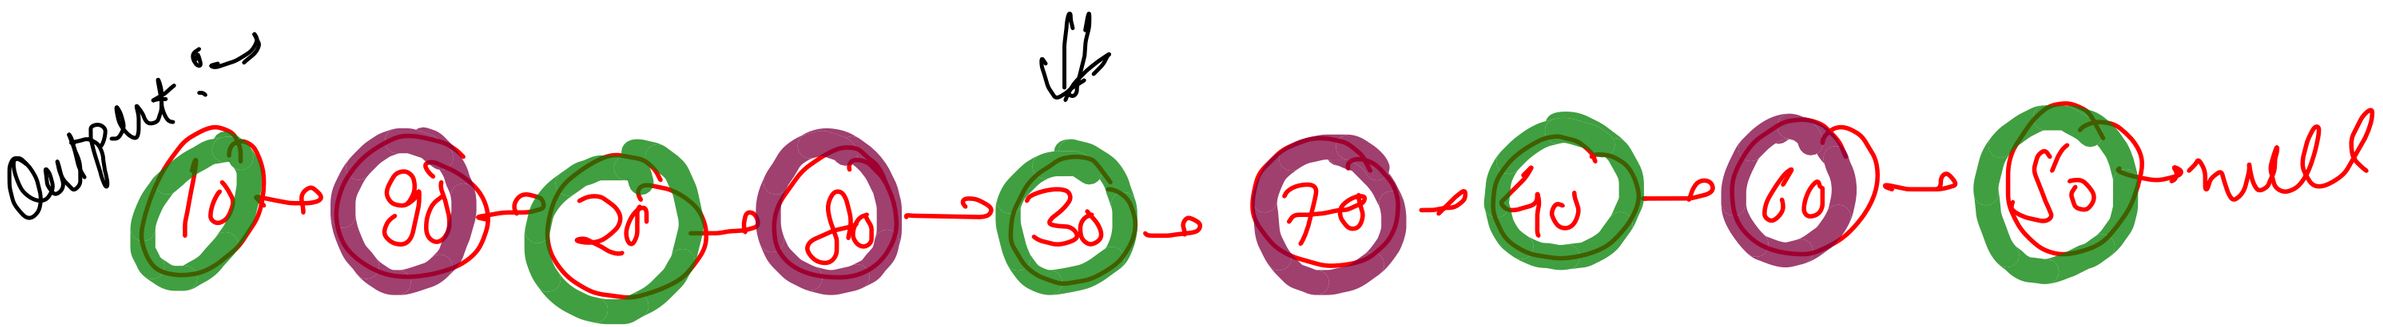




(1) Find middle → O(N)

(2) Second part - Reverse → O(N)

(3) Add Alternate Nodes → O(N)



```java
public ListNode getMiddle(ListNode head){}
public ListNode reverse(ListNode head){}

public void reorderList(ListNode head) {
    ListNode mid = getMiddle(head);
    ListNode second = reverse(mid.next);
    mid.next = null;

    ListNode dummy = new ListNode(-1);
    ListNode tail = dummy;

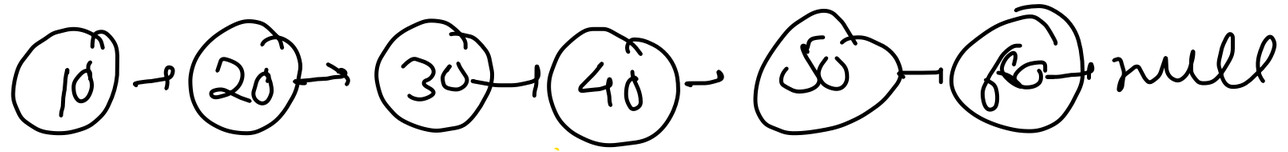
    while(head != null || second != null){
        if(head != null){
            tail.next = head;
            tail = head;
            head = head.next;
        }
        if(second != null){
            tail.next = second;
            tail = second;
            second = second.next;
        }
    }

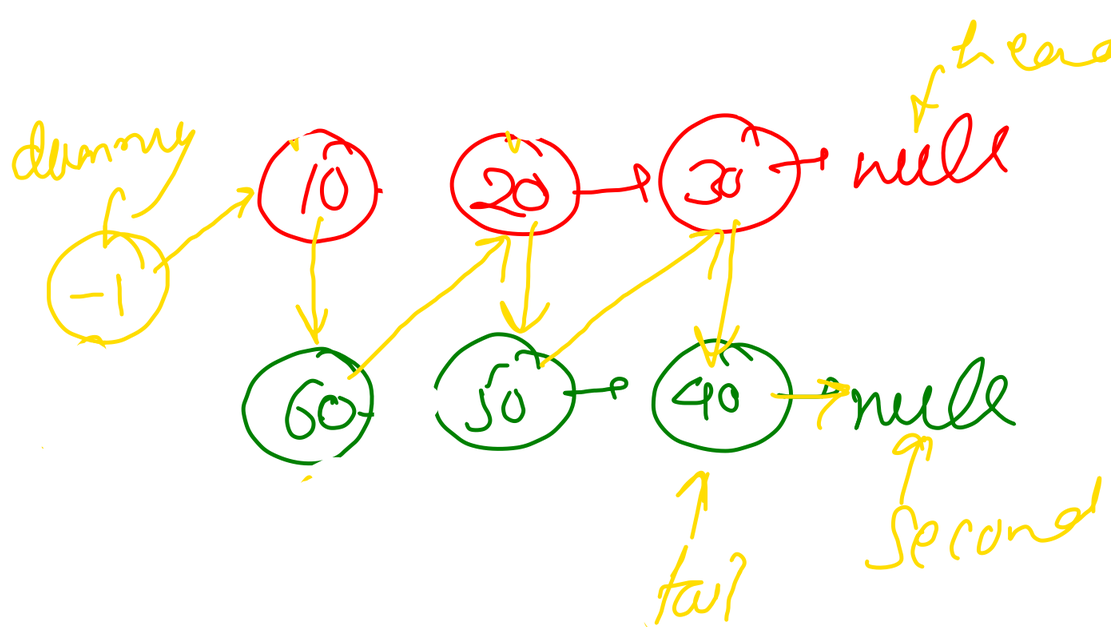
    tail.next = null;
    head = dummy.next;
}
```

O(N)

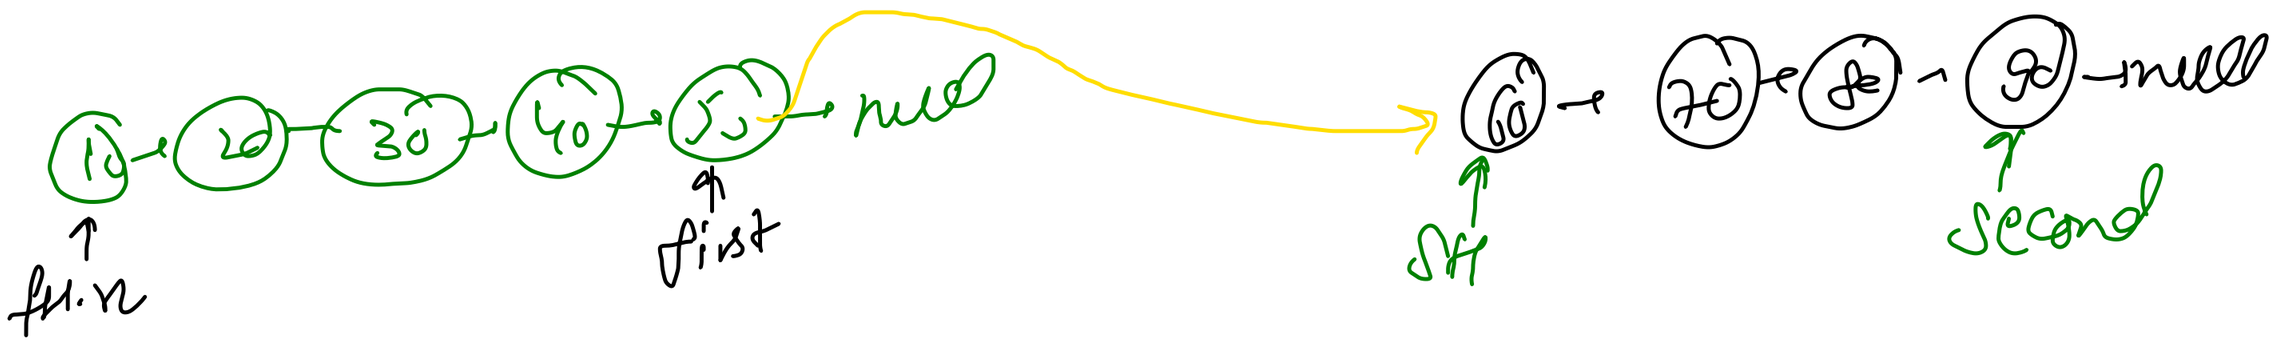
O(N)

O(N)





Unfold of a LL (Repeating)



```java
public static ListNode reverse(ListNode head){ }

public static void unfold(ListNode head) {
    ListNode firstHead = new ListNode(-1);
    ListNode secondHead = new ListNode(-1);
    ListNode first = firstHead, second = secondHead;

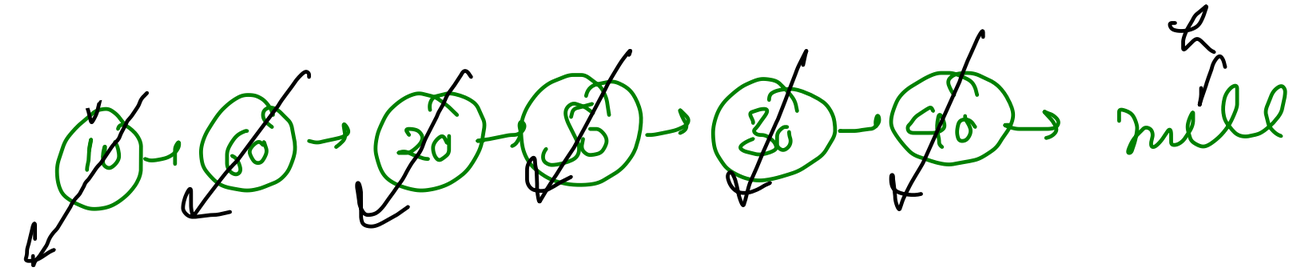
    while(head != null){
        first.next = head;
        first = head;
        head = head.next;

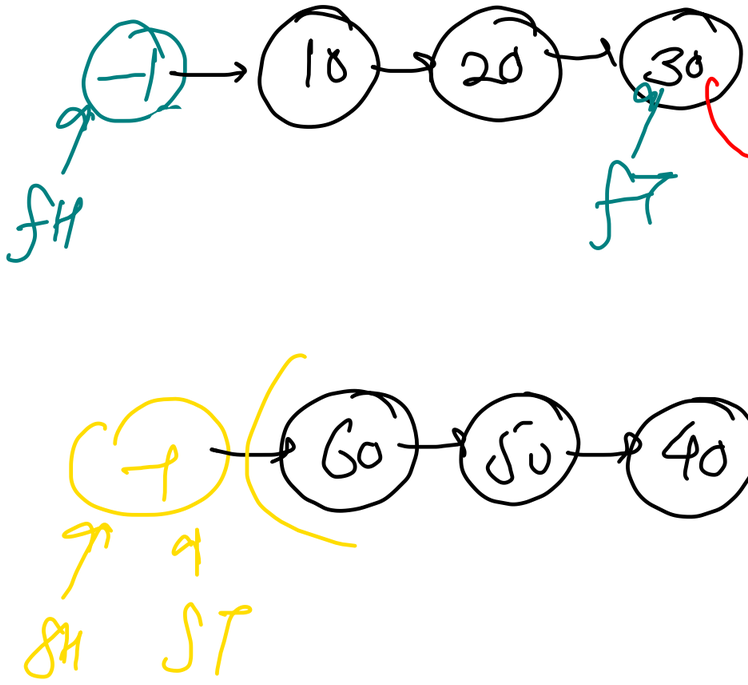
        if(head != null){
            second.next = head;
            second = head;
            head = head.next;
        }
    }

    first.next = null;
    second.next = null;

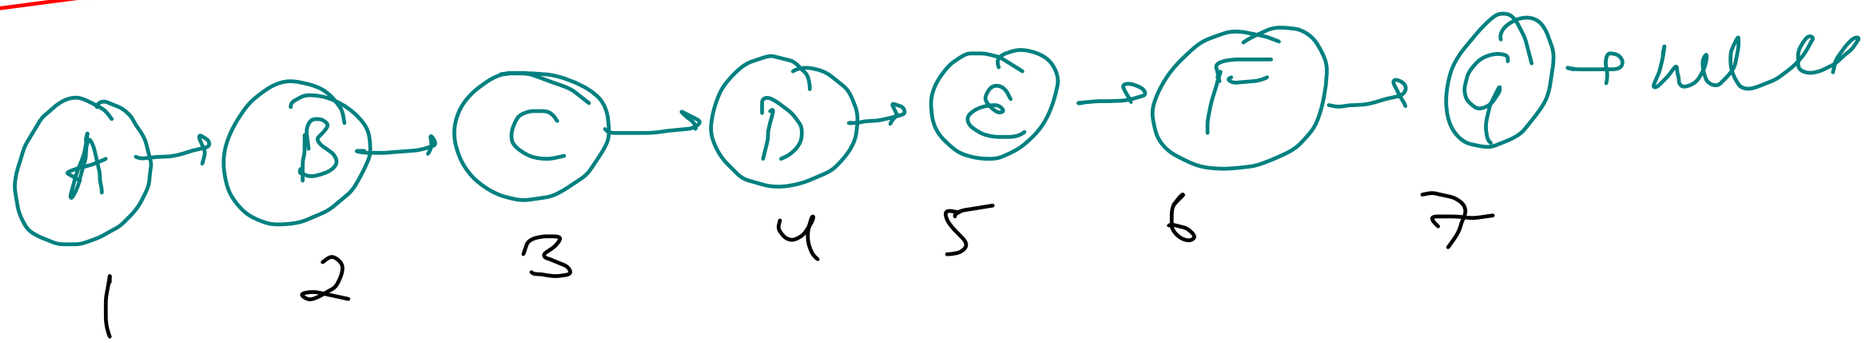
    first.next = reverse(secondHead.next);
    head = firstHead.next;
}
```

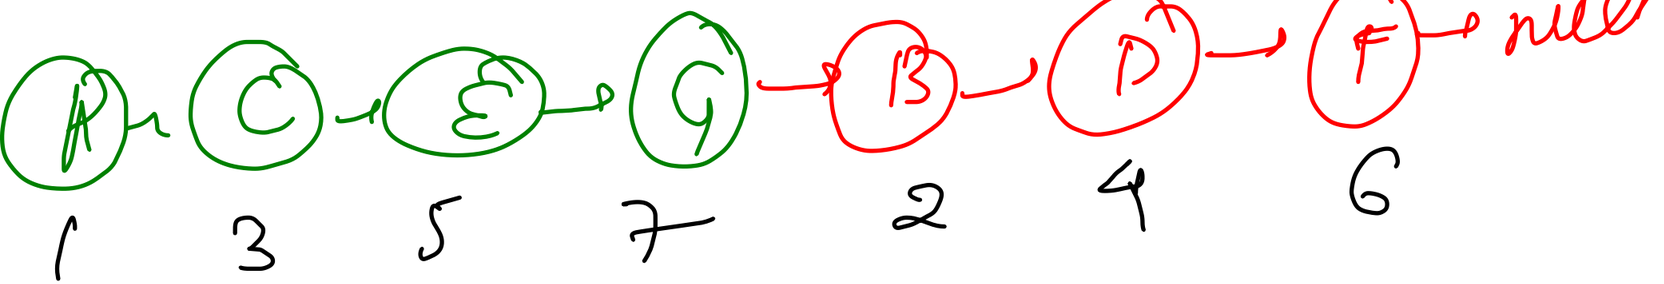
head.val = 1





Odd Even LL (By Index) {Unfold}





```java
public ListNode oddEvenList(ListNode head) {
    ListNode firstHead = new ListNode(-1);
    ListNode secondHead = new ListNode(-1);
    ListNode first = firstHead, second = secondHead;

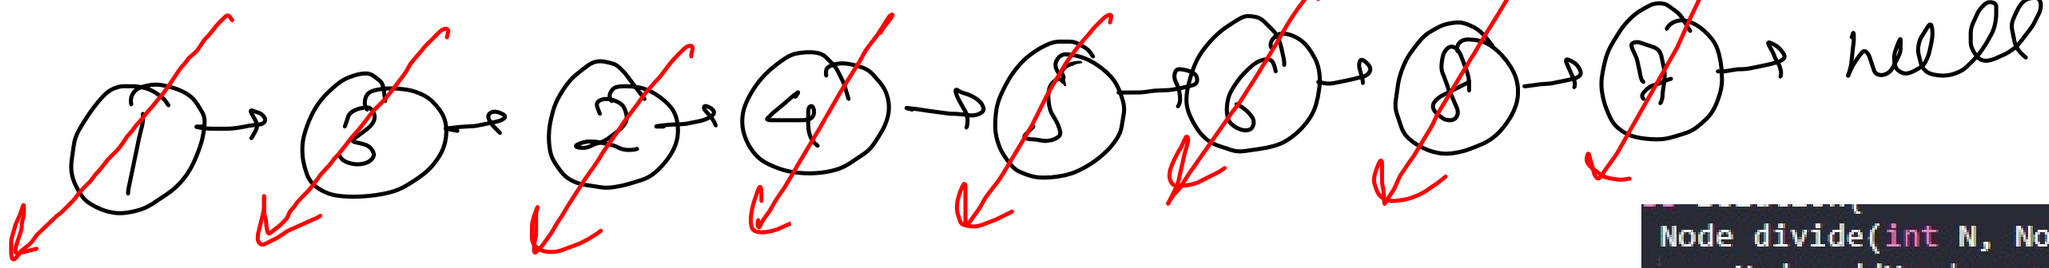
    while(head != null){
        first.next = head;
        first = head;
        head = head.next;

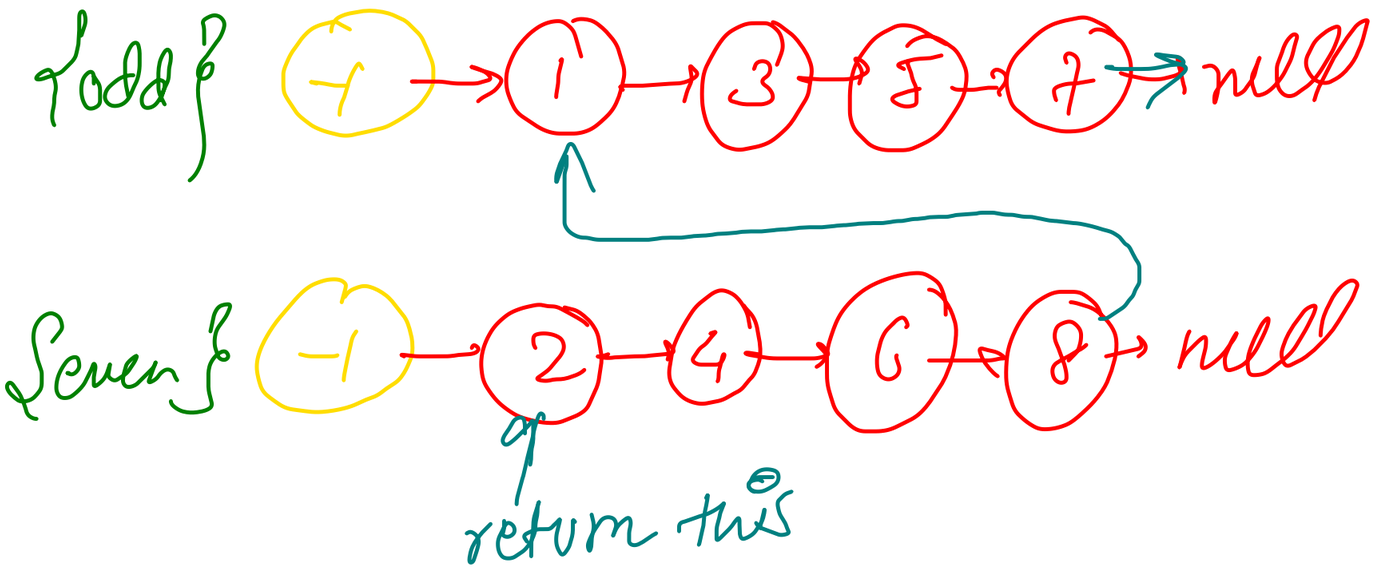
        if(head != null){
            second.next = head;
            second = head;
            head = head.next;
        }
    }

    second.next = null;
    first.next = secondHead.next;
    return firstHead.next;
}
```

Odd Even LL {By value} Sort 01

#Stable





```
Node divide(int N, Node head){
    Node oddHead = new Node(-1);
    Node evenHead = new Node(-1);
    Node odd = oddHead, even = evenHead;

    while(head != null){
        if(head.data % 2 == 1){
            odd.next = head;
            odd = head;
        } else {
            even.next = head;
            even = head;
        }
        head = head.next;
    }

    odd.next = null;
    even.next = oddHead.next;
    return evenHead.next;
}
```

Lecture (8) { Thursday → level (2) }

Pre-requisite

Hashmap

V. IMP.

→ Design LRU Cache (146)

→ Design LFU Cache (460)

→ Copy linked list with Random Ptr (138)

- With Extra Space
- W/o Extra Space

Design a data structure that follows the constraints of a **Least Recently Used (LRU) cache**.

Implement the `LRUCache` class:

- `LRUCache(int capacity)` Initialize the LRU cache with **positive** size `capacity`.
- `int get(int key)` Return the value of the `key` if the key exists, otherwise return `-1`.
- `void put(int key, int value)` Update the value of the `key` if the `key` exists. Otherwise, add the `key-value` pair to the cache. If the number of keys exceeds the `capacity` from this operation, **evict** the least recently used key.

The functions `get` and `put` must each run in `O(1)` average time complexity.
